## SOLUTIONS MANUAL

## SOLUTIONS MANUAL

## SOLUTIONS MANUAL

## Chapter 2

## An Introduction to Linear Programming

## Learning Objectives

1. Obtain an overview of the kinds of problems linear programming has been used to solve.
2. Learn how to develop linear programming models for simple problems.
3. Be able to identify the special features of a model that make it a linear programming model.
4. Learn how to solve two variable linear programming models by the graphical solution procedure.
5. Understand the importance of extreme points in obtaining the optimal solution.
6. Know the use and interpretation of slack and surplus variables.
7. Be able to interpret the computer solution of a linear programming problem.
8. Understand how alternative optimal solutions, infeasibility and unboundedness can occur in linear programming problems.
9. Understand the following terms:
problem formulation feasible region
constraint function
objective function
solution
optimal solution
nonnegativity constraints
mathematical model
linear program
slack variable
standard form
redundant constraint
extreme point
surplus variable
alternative optimal solutions
infeasibility
linear functions
unbounded
feasible solution

## Chapter 2

## Solutions:

1. $\mathrm{a}, \mathrm{b}$, and e , are acceptable linear programming relationships.
c is not acceptable because of $-2 B^{2}$
$d$ is not acceptable because of $3 \sqrt{A}$
f is not acceptable because of $1 A B$
c , d , and f could not be found in a linear programming model because they have the above nonlinear terms.
2. a .

b.

c.

3. a.

b.

c.

4. a.

May not be scanned, copied or duplicated, or posted to a publicly accessible website, in whole or in part.

## Chapter 2

b.

c.

5.

6.
$7 A+10 B=420$ is labeled (a)
$6 A+4 B=420$ is labeled (b)
$-4 A+7 B=420$ is labeled (c)

7.

## Chapter 2

8. 

9.

10.

$$
\begin{align*}
& A+2 B=6  \tag{1}\\
& 5 A+3 B=15  \tag{2}\\
& 5 A+10 B=30  \tag{3}\\
& \text { (2) } \begin{aligned}
-(3) \quad-7 B & =-15 \\
B & =15 / 7
\end{aligned}
\end{align*}
$$

From (1), $A=6-2(15 / 7)=6-30 / 7=12 / 7$

## Chapter 2

11. 

12. a.

c. There are four extreme points: $(0,0),(4,0),(3,1,5)$, and $(0,3)$.
13. a.

b. The extreme points are $(5,1)$ and $(2,4)$.

## Chapter 2

c.

14. a. Let $F=$ number of tons of fuel additive
$S=$ number of tons of solvent base

| Max | $40 F$ | + | $30 S$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| s.t. |  |  |  |  |  |  |
|  | $2 / 5 F$ | + | $1 / 2 S$ |  | 200 | Material 1 |
|  |  |  | $1 / 5 \mathrm{~S}$ |  | 5 | Material 2 |
|  | 3/5 F | + | $3 / 10 \mathrm{~S}$ |  | 21 | Material 3 |
|  | , $\mathrm{S}^{2} 0$ |  |  |  |  |  |

b.

c. Material 2: 4 tons are used, 1 ton is unused.
d. No redundant constraints.
15. a.

b. Similar to part (a): the same feasible region with a different objective function. The optimal solution occurs at $(708,0)$ with a profit of $z=20(708)+9(0)=14,160$.
c. The sewing constraint is redundant. Such a change would not change the optimal solution to the original problem.
16. a. A variety of objective functions with a slope greater than $-4 / 10$ (slope of $I \& P$ line) will make extreme point $(0,540)$ the optimal solution. For example, one possibility is $3 S+9 D$.
b. Optimal Solution is $S=0$ and $D=540$.
c.

| Department | Hours Used | Max. Available | Slack |
| :--- | :---: | :---: | :---: |
| Cutting and Dyeing | $1(540)=540$ | 630 | 90 |
| Sewing | $5 / 6(540)=450$ | 600 | 150 |
| Finishing | $2 / 3(540)=360$ | 708 | 348 |
| Inspection and Packaging | $1 / 4(540)=135$ | 135 | 0 |

17. 

$$
\begin{array}{lcccc}
\text { Max } & 5 A+2 B+0 S_{1}+0 S_{2}+0 S_{3} & \\
\text { s.t. } & \\
& 1 A-2 B+1 S_{1} & & \\
& 2 A+3 B & & \\
& 6 A-1 B & & \\
& A, B, S_{1}, S_{2}, S_{3} \geq 0
\end{array}
$$

18. a .

$$
\begin{array}{lrl}
\text { Max } & 4 A+1 B+0 S_{1}+0 S_{2}+0 S_{3} \\
\text { s.t. } & & \\
& 10 A+2 B+1 S_{1} & =30 \\
& 3 A+2 B & =12 \\
& 2 A+2 B & \\
& A, B, S_{1}, S_{2}, S_{3} \geq 0
\end{array}
$$

b.

c. $\quad S_{1}=0, S_{2}=0, S_{3}=4 / 7$
19. a.

$$
\begin{align*}
& \operatorname{Max} 3 A+4 B+0 S_{1}+0 S_{2}+0 S_{3} \\
& \text { s.t. } \\
& -1 A+2 B+1 S_{1}=8  \tag{1}\\
& 1 A+2 B+1 S_{2}=12  \tag{2}\\
& 2 A+1 B+1 S_{3}=16  \tag{3}\\
& A, B, S_{1}, S_{2}, S_{3} \geq 0
\end{align*}
$$

## Chapter 2

b.

c. $S_{1}=8+A-2 B=8+20 / 3-16 / 3=28 / 3$
$S_{2}=12-A-2 B=12-20 / 3-16 / 3=0$
$S_{3}=16-2 A-B=16-40 / 3-8 / 3=0$
20. a.

Max $3 A+2 B$
s.t.
b.

c. $\quad S_{1}=(3.43+3.43)-4=2.86$
$S_{2}=24-[3(3.43)+4(3.43)]=0$
$S_{3}=3.43-2=1.43$
$S_{4}=0-(3.43-3.43)=0$

## Chapter 2

21. a. and b.

c. Optimal solution occurs at the intersection of constraints 1 and 2. For constraint 2,

$$
B=10+A
$$

Substituting for $B$ in constraint 1 we obtain

$$
\begin{aligned}
5 A+5(10+A) & =400 \\
5 A+50+5 A & =400 \\
10 A & =350 \\
A & =35
\end{aligned}
$$

$$
B=10+A=10+35=45
$$

Optimal solution is $A=35, B=45$
d. Because the optimal solution occurs at the intersection of constraints 1 and 2, these are binding constraints.

$$
2-16
$$

e. Constraint 3 is the nonbinding constraint. At the optimal solution $1 A+3 B=1(35)+3(45)=170$. Because 170 exceeds the right-hand side value of 90 by 80 units, there is a surplus of 80 associated with this constraint.
22. a .

b.

| Extreme Point | Coordinates | Profit |
| :---: | :---: | :--- |
| 1 | $(0,0)$ | $5(0)+4(0)=0$ |
| 2 | $(1700,0)$ | $5(1700)+4(0)=8500$ |
| 3 | $(1400,600)$ | $5(1400)+4(600)=9400$ |
| 4 | $(800,1200)$ | $5(800)+4(1200)=8800$ |
| 5 | $(0,1680)$ | $5(0)+4(1680)=6720$ |

Extreme point 3 generates the highest profit.
c. Optimal solution is $A=1400, C=600$
d. The optimal solution occurs at the intersection of the cutting and dyeing constraint and the inspection and packaging constraint. Therefore these two constraints are the binding constraints.
e. New optimal solution is $A=800, C=1200$

Profit $=4(800)+5(1200)=9200$
23. a. Let $E=$ number of units of the EZ-Rider produced $L=$ number of units of the Lady-Sport produced

$$
\begin{array}{lrll}
\text { Max } & 2400 E+1800 L & & \\
\text { s.t. } & & \\
& 6 E+3 L & \leq 2100 & \text { Engine time } \\
& & \leq 280 & \text { Lady-Sport maximum } \\
& 2 E+ & \leq 1000 & \text { Assembly and testing } \\
& E, L \geq 0
\end{array}
$$

b.

c. The binding constraints are the manufacturing time and the assembly and testing time.
24. a. Let $R=$ number of units of regular model.
$C=$ number of units of catcher's model.

| Max | $5 R$ | + | $8 C$ |  |  |
| :---: | :---: | :---: | :---: | :--- | :--- |
| s.t. |  |  |  |  |  |
|  | $1 R$ | $+3 / 2 C$ | $\leq$ | 900 | Cutting and sewing |
|  | $1 / 2 R$ | $+1 / 3 C$ | $\leq$ | 300 | Finishing |
|  | $1 / 8 R$ | + | $1 / 4 C$ | $\leq$ | 100 | Packing and Shipping

b.

c. $5(500)+8(150)=\$ 3,700$
d. $\quad \mathrm{C} \& \mathrm{~S} \quad 1(500)+3 / 2(150)=725$

F $\quad 1 / 2(500)+1 / 3(150)=300$
P \& S $\quad 1 / 8(500)+1 / 4(150)=100$
e.

| Department | Capacity | Usage | Slack |
| :---: | :---: | :---: | :---: |
| C \& S | 900 | 725 | 175 hours |
| F | 300 | 300 | 0 hours |
| P \& S | 100 | 100 | 0 hours |

25. a. Let $B=$ percentage of funds invested in the bond fund
$S=$ percentage of funds invested in the stock fund
Max $\quad 0.06 B+\quad 0.10 S$
s.t.

$$
\begin{array}{rrccl}
B & & \geq & 0.3 & \text { Bond fund minimum } \\
0.06 B+ & 0.10 S & \geq & 0.075 & \text { Minimum return } \\
B+ & S & = & 1 & \\
\text { Percentage requirement }
\end{array}
$$

b. Optimal solution: $B=0.3, S=0.7$

Value of optimal solution is 0.088 or $8.8 \%$
26. a. a. Let $N=$ amount spent on newspaper advertising

$$
R=\text { amount spent on radio advertising }
$$

Max $50 N+80 R$
s.t.

$$
\begin{array}{rlrl}
N+R & =1000 & \text { Budget } \\
N & & 250 & \text { Newspaper min. } \\
R & \geq 250 & \text { Radio min. } \\
N & -2 R & \geq 0 \text { News } \geq 2 \text { Radio }
\end{array}
$$

$$
N, R \geq 0
$$

b.

27. Let $I=$ Internet fund investment in thousands
$B=$ Blue Chip fund investment in thousands

Max $0.12 I+0.09 B$
s.t.

| 1 I | $+$ | $1 B$ | $\leq$ | 50 | Available investment funds |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 I |  |  | $\leq$ | 35 | Maximum investment in the internet fund |
| $6 I$ | + | $4 B$ | $\leq$ | 240 | Maximum risk for a moderate investor |
|  | $I, B \geq 0$ |  |  |  |  |

| Internet fund | $\$ 20,000$ |
| :--- | :--- |
| Blue Chip fund | $\$ 30,000$ |
| Annual return | $\$ 5,100$ |

b. The third constraint for the aggressive investor becomes

$$
6 I+4 B \leq 320
$$

This constraint is redundant; the available funds and the maximum Internet fund investment constraints define the feasible region. The optimal solution is:

| Internet fund | $\$ 35,000$ |
| :--- | :--- |
| Blue Chip fund | $\$ 15,000$ |
| Annual return | $\$ 5,550$ |

The aggressive investor places as much funds as possible in the high return but high risk Internet fund.
c. The third constraint for the conservative investor becomes

$$
6 I+4 B \leq 160
$$

This constraint becomes a binding constraint. The optimal solution is

| Internet fund | $\$ 0$ |
| :--- | :--- |
| Blue Chip fund | $\$ 40,000$ |
| Annual return | $\$ 3,600$ |

$$
2-21
$$

© 2010 Cengage Learning. All Rights Reserved.
May not be scanned, copied or duplicated, or posted to a publicly accessible website, in whole or in part.

The slack for constraint 1 is $\$ 10,000$. This indicates that investing all $\$ 50,000$ in the Blue Chip fund is still too risky for the conservative investor. $\$ 40,000$ can be invested in the Blue Chip fund. The remaining $\$ 10,000$ could be invested in low-risk bonds or certificates of deposit.
28. a. Let $W=$ number of jars of Western Foods Salsa produced $M=$ number of jars of Mexico City Salsa produced

Max $1 W+1.25 M$
s.t.

| $5 W$ | $7 M$ | $\leq 4480$ | Whole tomatoes |
| :--- | :--- | :--- | :--- |
| $3 W+$ | $1 M$ | $\leq 2080$ | Tomato sauce |
| $2 W+$ | $2 M$ | $\leq 1600$ | Tomato paste |
| $W, M \geq 0$ |  |  |  |

Note: units for constraints are ounces
b. Optimal solution: $W=560, M=240$

Value of optimal solution is 860
29. a. Let $B=$ proportion of Buffalo's time used to produce component 1 $D=$ proportion of Dayton's time used to produce component 1

|  | Maximum Daily Production <br> Component 1 <br> Component 2 |  |
| :--- | :---: | :---: |
| Buffalo | 2000 | 1000 |
| Dayton | 600 | 1400 |

Number of units of component 1 produced: $2000 B+600 D$
Number of units of component 2 produced: $1000(1-B)+600(1-D)$

For assembly of the ignition systems, the number of units of component 1 produced must equal the number of units of component 2 produced.

Therefore,

$$
\begin{aligned}
& 2000 B+600 D=1000(1-B)+1400(1-D) \\
& 2000 B+600 D=1000-1000 B+1400-1400 D \\
& 3000 B+2000 D=2400
\end{aligned}
$$

Note: Because every ignition system uses 1 unit of component 1 and 1 unit of component 2, we can maximize the number of electronic ignition systems produced by maximizing the number of units of subassembly 1 produced.

Max $2000 B+600 D$
In addition, $B \leq 1$ and $D \leq 1$.

The linear programming model is:

| Max | $2000 B+600 D$ |  |  |
| :--- | ---: | :--- | :--- |
| s.t. |  |  |  |
|  | $3000 B$ | $+2000 D$ | $=2400$ |
|  | $B$ |  | $\leq 1$ |
|  |  | $D$ | $\leq 1$ |
|  |  | $B, D$ | $\geq 0$ |

The graphical solution is shown below.

Optimal Solution: $B=.8, D=0$

Optimal Production Plan

| Buffalo - Component 1 | $.8(2000)=1600$ |
| :--- | :--- |
| Buffalo - Component 2 | $.2(1000)=200$ |
| Dayton - Component 1 | $0(600)=0$ |
| Dayton - Component 2 | $1(1400)=1400$ |

Total units of electronic ignition system $=1600$ per day.

## Chapter 2

30. a. Let $E=$ number of shares of Eastern Cable
$C=$ number of shares of ComSwitch

| Max | $15 E+18 C$ |  |  |
| :--- | :--- | :--- | :--- |
| s.t. |  |  |  |
|  | $40 E+25 C$ | $\leq 50,000$ | Maximum Investment |
|  | $40 E$ | $\geq 15,000$ | Eastern Cable Minimum |
|  |  | $25 C$ | $\geq 10,000$ |
| ComSwitch Minimum |  |  |  |
|  | $E, C \geq 0$ |  |  |

b.

c. There are four extreme points: $(375,400) ;(1000,400) ;(625,1000) ;(375,1000)$
d. Optimal solution is $E=625, C=1000$ Total return $=\$ 27,375$
31.

Optimal Solution
$A=3, B=1$

Objective Function Value $=13$
32.

## Chapter 2

| Extreme Points | Objective <br> Function Value | Surplus <br> Demand | Surplus <br> Total Production | Slack <br> Processing Time |
| :---: | :---: | :---: | :---: | :---: |
| $(A=250, B=100)$ | 800 | 125 | - | - |
| $(A=125, B=225)$ | 925 | - | - | 125 |
| $(A=125, B=350)$ | 1300 | - | 125 | - |

33. a .

Optimal Solution: $A=3, B=1$, value $=5$
b.
(1) $3+4(1)=7$
Slack $=21-7=14$
(2) $2(3)+1=7$
Surplus $=7-7=0$
(3) $3(3)+1.5=10.5$
Slack $=21-10.5=10.5$
(4) $-2(3)+6(1)=0$
Surplus $=0-0=0$
c.

Optimal Solution: $A=6, B=2$, value $=34$
34. a.

b. There are two extreme points: $(A=4, B=1)$ and $(A=21 / 4, B=9 / 4)$
c. The optimal solution is $A=4, B=1$

Chapter 2
35. a.

| Min | 6 A | + | $4 B$ | + | $S_{1}$ | + | $\mathrm{S}_{2}$ | $+$ | $S_{3}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $2 A$ | + | $1 B$ | - | $S_{1}$ |  |  |  |  | $=$ | 12 |
|  | 1 A | + | $1 B$ |  |  | - | $S_{2}$ |  |  | $=$ | 10 |
|  |  |  | $1 B$ |  |  |  |  | + | $S_{3}$ | $=$ | 4 |

A, $B, S_{1}, S_{2}, S_{3} \geq 0$
b. The optimal solution is $A=6, B=4$.
c. $S_{1}=4, S_{2}=0, S_{3}=0$.
36. a. Let $T=$ number of training programs on teaming $P=$ number of training programs on problem solving

Max $10,000 T+8,000 P$
s.t.

| $T$ |  | $\geq 8$ | Minimum Teaming |
| ---: | :--- | :--- | :--- |
|  | $P$ | $\geq 10$ | Minimum Problem Solving |
| $T+$ | $P$ | $\geq 25$ | Minimum Total |
| $3 T+$ | $2 P$ | $\leq 84$ | Days Available |
|  |  |  |  |
| $T, P \geq 0$ |  |  |  |

b.

c. There are four extreme points: $(15,10) ;(21.33,10) ;(8,30) ;(8,17)$
d. The minimum cost solution is $T=8, P=17$

Total cost $=\$ 216,000$
37.

|  | Regular | Zesty |  |
| ---: | :---: | :---: | :---: |
| Mild | $80 \%$ | $60 \%$ | 8100 |
| Extra Sharp | $20 \%$ | $40 \%$ | 3000 |

Let $R=$ number of containers of Regular
$Z=$ number of containers of Zesty
Each container holds $12 / 16$ or 0.75 pounds of cheese

$$
\begin{aligned}
\text { Pounds of mild cheese used } & =0.80(0.75) R+0.60(0.75) Z \\
& =0.60 R+0.45 Z
\end{aligned}
$$

Pounds of extra sharp cheese used $=0.20(0.75) R+0.40(0.75) Z$

$$
=0.15 R+0.30 Z
$$

```
Cost of Cheese \(=\) Cost of mild + Cost of extra sharp
    \(=1.20(0.60 R+0.45 Z)+1.40(0.15 R+0.30 Z)\)
    \(=0.72 R+0.54 Z+0.21 R+0.42 Z\)
    \(=0.93 R+0.96 Z\)
Packaging Cost \(=0.20 R+0.20 Z\)
Total Cost \(\quad=(0.93 R+0.96 Z)+(0.20 R+0.20 Z)\)
    \(=1.13 R+1.16 Z\)
Revenue \(\quad=1.95 R+2.20 Z\)
Profit Contribution \(=\) Revenue - Total Cost
    \(=(1.95 R+2.20 Z)-(1.13 R+1.16 Z)\)
    \(=0.82 R+1.04 Z\)
    Max \(\quad 0.82 R+1.04 Z\)
    s.t.
        \(0.60 R+0.45 Z \leq 8100 \quad\) Mild
        \(0.15 R+0.30 Z \leq 3000 \quad\) Extra Sharp
        \(R, \mathrm{Z} \geq 0\)
```

Optimal Solution: $R=9600, Z=5200$, profit $=0.82(9600)+1.04(5200)=\$ 13,280$
38. a. Let $S=$ yards of the standard grade material per frame $P=$ yards of the professional grade material per frame

Min $7.50 S+9.00 P$
s.t.

$$
\begin{aligned}
& 0.10 S+0.30 P \geq 6 \\
& 0.06 S+0.12 P \leq 3 \\
& \text { carbon fiber (at least } 20 \% \text { of } 30 \text { yards) } \\
& S+P=30
\end{aligned} \begin{array}{ll}
\text { total ( } 30 \text { yords) }
\end{array}
$$

b.

c.

| Extreme Point | Cost |
| :---: | :---: |
| $(15,15)$ | $7.50(15)+9.00(15)=247.50$ |
| $(10,20)$ | $7.50(10)+9.00(20)=255.00$ |

The optimal solution is $S=15, P=15$
d. Optimal solution does not change: $S=15$ and $P=15$. However, the value of the optimal solution is reduced to $7.50(15)+8(15)=\$ 232.50$.
e. At $\$ 7.40$ per yard, the optimal solution is $S=10, P=20$. The value of the optimal solution is reduced to $7.50(10)+7.40(20)=\$ 223.00$. A lower price for the professional grade will not change the $S=10, P=20$ solution because of the requirement for the maximum percentage of kevlar ( $10 \%$ ).
39. a. Let $S=$ number of units purchased in the stock fund
$M=$ number of units purchased in the money market fund
Min $8 S+3 M$
s.t.

| 50S | + | 100 M | $\leq$ | 1,200,000 | Funds available |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $5 S$ | + | $4 M$ | $\geq$ | 60,000 | Annual income |
|  |  | $M$ | $\geq$ | 3,000 | Minimum units |

$$
S, M, \geq 0
$$

Optimal Solution: $S=4000, M=10000$, value $=62000$
b. Annual income $=5(4000)+4(10000)=60,000$
c. Invest everything in the stock fund.
40. Let $P_{1}=$ gallons of product 1 $P_{2}=$ gallons of product 2

| Min | $1 P_{1}$ | $+1 P_{2}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :--- |
| s.t. |  |  |  |  |  |
|  | $1 P_{1}$ | + |  | $\geq$ | 30 |
|  |  |  | Product 1 minimum |  |  |
|  | $1 P_{1}$ | $+\quad 2 P_{2}$ | $\geq$ | 20 | Product 2 minimum |
|  |  | $P_{1}, P_{2} \geq 0$ |  |  | Raw material |

Optimal Solution: $P_{1}=30, P_{2}=25$ Cost $=\$ 55$
41. a. Let $R=$ number of gallons of regular gasoline produced
$P=$ number of gallons of premium gasoline produced
Max $0.30 R+0.50 P$
s.t.

$$
\begin{array}{rrrl}
0.30 R & +0.60 P & \leq 18,000 & \\
\text { Grade A crude oil available } \\
1 R & 1 P & \leq 50,000 & \text { Production capacity } \\
& 1 P & \leq 20,000 & \text { Demand for premium }
\end{array}
$$

$$
R, P \geq 0
$$

## Chapter 2

b.

Gallons of Regular Gasoline

Optimal Solution:
40,000 gallons of regular gasoline
10,000 gallons of premium gasoline
Total profit contribution $=\$ 17,000$
c.

| Constraint | Value of Slack <br> Variable | Interpretation |
| :---: | :---: | :--- |
| 1 | 0 | All available grade A crude oil is used |
| 2 | 0 | Total production capacity is used |
| 3 | 10,000 | Premium gasoline production is 10,000 gallons less than <br> the maximum demand |

d. Grade A crude oil and production capacity are the binding constraints.
42.

43.

Unbounded
44. a.

b. New optimal solution is $A=0, B=3$, value $=6$.
45. a.

b. Feasible region is unbounded.
c. Optimal Solution: $A=3, B=0, z=3$.
d. An unbounded feasible region does not imply the problem is unbounded. This will only be the case when it is unbounded in the direction of improvement for the objective function.
46.

Let $N=$ number of sq. ft . for national brands $G=$ number of sq. ft . for generic brands

Problem Constraints:

| $N$ | + |  | $\leq$ |
| ---: | :--- | :--- | :--- |
| $N$ |  | 200 | Space available |
|  |  |  | 120 |
| National brands |  |  |  |
|  |  | 20 | Generic |

a. Optimal solution is extreme point 2; 180 sq . ft. for the national brand and 20 sq . ft . for the generic brand.
b. Alternative optimal solutions. Any point on the line segment joining extreme point 2 and extreme point 3 is optimal.
c. Optimal solution is extreme point $3 ; 120 \mathrm{sq}$. ft. for the national brand and 80 sq . ft . for the generic brand.
47.

Alternative optimal solutions exist at extreme points $(A=125, B=225)$ and $(A=250, B=100)$.

$$
\text { Cost }=3(125)+3(225)=1050
$$

or

$$
\text { Cost }=3(250)+3(100)=1050
$$

The solution $(A=250, B=100)$ uses all available processing time. However, the solution ( $A=125, B=225$ ) uses only $2(125)+1(225)=475$ hours.

Thus, $(A=125, B=225)$ provides $600-475=125$ hours of slack processing time which may be used for other products.

$$
2-38
$$

48. 

Possible Actions:
i. Reduce total production to $A=125, B=350$ on 475 gallons.
ii. Make solution $A=125, B=375$ which would require $2(125)+1(375)=625$ hours of processing time. This would involve 25 hours of overtime or extra processing time.
iii. Reduce minimum $A$ production to 100 , making $A=100, B=400$ the desired solution.
49. a. Let $\mathrm{P}=$ number of full-time equivalent pharmacists
$\mathrm{T}=$ number of full-time equivalent physicians
The model and the optimal solution are shown below:
MIN $40 \mathrm{P}+10 \mathrm{~T}$
S.T.

1) $\mathrm{P}+\mathrm{T} \quad>=250$
2) $2 \mathrm{P}-\mathrm{T}>=0$
3) $\quad \mathrm{P}>=90$

Optimal Objective Value
5200.00000

| Variable | Value | Reduced Cost |
| :---: | ---: | ---: |
| P | 90.00000 | 0.00000 |
| T | 160.00000 | 0.00000 |

| Constraint | Slack/Surplus | Dual Value |
| :---: | ---: | ---: |
| 1 | 0.00000 | 10.00000 |
| 2 | 20.00000 | 0.00000 |
| 3 | 0.00000 | 30.00000 |

The optimal solution requires 90 full-time equivalent pharmacists and 160 full-time equivalent technicians. The total cost is $\$ 5200$ per hour.
b.

|  | Current Levels | Attrition | Optimal Values | New Hires Required |
| :--- | :---: | :---: | :---: | :---: |
| Pharmacists | 85 | 10 | 90 | 15 |
| Technicians | 175 | 30 | 160 | 15 |

The payroll cost using the current levels of 85 pharmacists and 175 technicians is $40(85)+10(175)=$ $\$ 5150$ per hour.

The payroll cost using the optimal solution in part (a) is $\$ 5200$ per hour.
Thus, the payroll cost will go up by $\$ 50$
50. Let $M=$ number of Mount Everest Parkas
$R=$ number of Rocky Mountain Parkas
Max $100 M+150 R$
s.t.

| $30 M+20 R$ | $\leq$ | 7200 | Cutting time |
| :---: | :---: | :---: | :---: | :---: |
| $45 M+15 R$ | $\leq$ | 7200 | Sewing time |
| $0.8 M-0.2 R$ | $\geq$ | $0 \quad \%$ requirement |  |

Note: Students often have difficulty formulating constraints such as the \% requirement constraint. We encourage our students to proceed in a systematic step-by-step fashion when formulating these types of constraints. For example:
$M$ must be at least $20 \%$ of total production
$M \geq 0.2$ (total production)
$M \geq 0.2(M+R)$
$M \geq 0.2 M+0.2 R$
$0.8 M-0.2 R \geq 0$

The optimal solution is $M=65.45$ and $R=261.82$; the value of this solution is $z=100(65.45)+$ $150(261.82)=\$ 45,818$. If we think of this situation as an on-going continuous production process, the fractional values simply represent partially completed products. If this is not the case, we can approximate the optimal solution by rounding down; this yields the solution $M=65$ and $R=261$ with a corresponding profit of $\$ 45,650$.
51. Let $C=$ number sent to current customers
$N=$ number sent to new customers

Note:

Number of current customers that test drive $=.25 C$

Number of new customers that test drive $=.20 \mathrm{~N}$

```
Number sold \(=.12(.25 C)+.20(.20 N)\)
                        \(=.03 C+.04 N\)
    Max . \(03 \mathrm{C}+.04 \mathrm{~N}\)
    s.t.
\[
\begin{array}{rllrl}
.25 C & & \geq & 30,000 & \text { Current Min } \\
& .20 N & \geq & 10,000 & \text { New Min } \\
.25 C \quad-\quad .40 N & \geq & 0 & \text { Current vs. New } \\
4 C+\quad 6 N & \leq 1,200,000 & \text { Budget } \\
C, N, \geq 0 & & &
\end{array}
\]
```

## Chapter 2

52. Let $S=$ number of standard size rackets $O=$ number of oversize size rackets

| Max | $10 S$ | + | $15 O$ |  |  |
| ---: | :---: | :---: | :---: | :--- | :--- |
| s.t. |  |  |  |  |  |
|  | $0.8 S$ | - | $0.2 O$ | $\geq$ | 0 | \% standard

53. a. Let $R=$ time allocated to regular customer service $N=$ time allocated to new customer service

| Max | $1.2 R$ | + | $N$ |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| s.t. |  |  |  |  |  |
|  | $R$ | + | $N$ | $\leq$ | 80 |
|  | $25 R$ | + | $8 N$ | $\geq$ | 800 |
|  | $-0.6 R$ | + | $N$ | $\geq$ | 0 |
|  |  | $R, N, \geq 0$ |  |  |  |

b.

| Optimal Objective Value |  |  |
| :---: | :---: | ---: |
| 90.00000 |  |  |
|  |  |  |
| Variable | Value | Reduced Cost |
| R | 50.00000 | 0.00000 |
| N | 30.00000 | 0.00000 |
|  |  |  |
| Constraint | Slack/Surplus | Dual Value |
| 1 | 0.00000 | 1.12500 |
| 2 | 690.00000 | 0.00000 |
| 3 | 0.00000 | -0.12500 |

Optimal solution: $R=50, N=30$, value $=90$

HTS should allocate 50 hours to service for regular customers and 30 hours to calling on new customers.
54. a. Let $M_{1}=$ number of hours spent on the $\mathrm{M}-100$ machine
$M_{2}=$ number of hours spent on the M-200 machine

Total Cost

$$
6(40) M_{1}+6(50) M_{2}+50 M_{1}+75 M_{2}=290 M_{1}+375 M_{2}
$$

Total Revenue

$$
25(18) M_{1}+40(18) M_{2}=450 M_{1}+720 M_{2}
$$

Profit Contribution

$$
(450-290) M_{1}+(720-375) M_{2}=160 M_{1}+345 M_{2}
$$

| Max | $160 M_{1}$ | + | $345 M_{2}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| s.t. |  |  |  |  |  |  |
|  | $M_{1}$ |  |  | $\leq$ | 15 | M-100 maximum |
|  |  |  | $M_{2}$ | $\leq$ | 10 | M-200 maximum |
|  | $M_{1}$ |  |  | $\geq$ | 5 | M-100 minimum |
|  |  |  | $M_{2}$ | $\geq$ | 5 | M-200 minimum |
|  | $40 M_{1}$ | + | $50 M_{2}$ | $\leq$ | 1000 | Raw material available |

b.

Optimal Objective Value
5450.00000

| Variable | Value | Reduced Cost |
| :---: | :---: | ---: |
| M1 | 12.50000 | 0.00000 |
| M2 | 10.00000 | 145.00000 |

Constraint
1
2
3
4
5
Slack/Surplus
2.50000
0.00000
7.50000
5.00000
0.00000
Dual Value
0.00000
145.00000
0.00000
0.00000
4.00000

The optimal decision is to schedule 12.5 hours on the $\mathrm{M}-100$ and 10 hours on the $\mathrm{M}-200$.
55. Mr. Krtick's solution cannot be optimal. Every department has unused hours, so there are no binding constraints. With unused hours in every department, clearly some more product can be made.
56. No, it is not possible that the problem is now infeasible. Note that the original problem was feasible (it had an optimal solution). Every solution that was feasible is still feasible when we change the constraint to less-than-or-equal-to, since the new constraint is satisfied at equality (as well as inequality). In summary, we have relaxed the constraint so that the previous solutions are feasible (and possibly more satisfying the constraint as strict inequality).
57. Yes, it is possible that the modified problem is infeasible. To see this, consider a redundant greater-than-or-equal to constraint as shown below. Constraints 2, 3, and 4 form the feasible region and constraint 1 is redundant. Change constraint 1 to less-than-or-equal-to and the modified problem is infeasible.

## Original Problem:

Modified Problem:

58. It makes no sense to add this constraint. The objective of the problem is to minimize the number of products needed so that everyone's top three choices are included. There are only two possible outcomes relative to the boss' new constraint. First, suppose the minimum number of products is $<=$ 15 , then there was no need for the new constraint. Second, suppose the minimum number is $>15$. Then the new constraint makes the problem infeasible.
