and the Environment

ERIC L. McFARLAND | JAMES L. HEY | JOHN L. CAMPBELL

CHAPTER 1

1-1. $v = 82 \frac{\text{km}}{\text{h}} \times \frac{1\text{h}}{3600\text{s}} \times 1000 \frac{\text{m}}{\text{km}} = 22.8 \frac{\text{m}}{\text{s}}$

$$KE = \frac{1}{2}mv^2 = \frac{1}{2}(4.5 \times 10^3 \text{ kg})(22.8 \text{ m/s})^2 = 1.2 \text{ MJ}$$

1-2. (a) $5.82 \text{ Btu} \times 1055 \frac{\text{J}}{\text{Btu}} \times \frac{1}{4184} \frac{\text{Cal}}{\text{J}} = 1.47 \text{ Cal}$

(b) $22 \text{ tonnes(oil)} \times 4.0 \times 10^7 \frac{\text{Btu}}{\text{tonne}} \times \frac{1}{10^{15}} \frac{\text{quad}}{\text{Btu}} = 8.8 \times 10^{-7} \text{ quad}$

(c) $52 \times 10^9 \text{ bl} \times 5.5 \times 10^6 \frac{\text{Btu}}{\text{Bl}} \times \frac{1}{10^{15}} \frac{\text{quad}}{\text{Btu}} = 2.9 \times 10^2 \text{ quad}$

1-3. $P = \frac{W}{t} = \frac{\Delta KE}{t}$

Work = change in KE

$$\frac{1}{2}mv^2 = Pt$$

$$v^2 = \frac{2Pt}{m}$$

$$v = \sqrt{\frac{2Pt}{m}} = \sqrt{\frac{2(5.1 \times 10^2 \text{ W})(7.2 \text{ s})}{67 \text{ kg}}} = 1.0 \times 10^1 \text{ m/s}$$

1-4. (a) $1 \text{ kW}\cdot\text{h} = 1000 \text{ J/s} \times 3600 \text{ s} = 3.6 \times 10^6 \text{ J}$

(b) $581 \text{ kW}\cdot\text{h} \times 3.6 \times 10^6 \text{ J/kW}\cdot\text{h} = 2.09 \times 10^9 \text{ J}$

1-5. $178000 \text{ TW}\cdot\text{yr} = 1.78 \times 10^5 \text{ TW}\cdot\text{yr} \times 10^{12} \frac{\text{W}}{\text{TW}} \times (365 \times 24 \times 3600) \frac{\text{s}}{\text{yr}}$
 $= 5.61 \times 10^{24} \text{ J}$

1-6. (a) $P = (145 + 512 + 500 + 2 + 177) \text{ W} = 1336 \text{ W}$

Energy = $1.336 \text{ kW} \times 2 \text{ h} = 2.67 \text{ kW}\cdot\text{h}$

(b) Cost = $2.67 \text{ kW}\cdot\text{h} \times 0.12 \text{ \$/kW h} = \$0.32$

1-7. Cost = $(600 \text{ kW}\cdot\text{h} \times 10\text{¢/kW}\cdot\text{h}) + ((1475 - 600) \text{ kW}\cdot\text{h} \times 11\text{¢/kW}\cdot\text{h})$

$$= 15625\text{¢} = \$156.25$$

$$\text{Average cost per kW}\cdot\text{h} = 15625\text{¢}/1475 \text{ kW}\cdot\text{h} = 10.59\text{¢}/\text{kW}\cdot\text{h}$$

1-8. $770 \text{ kW} = 770 \times 10^3 \text{ J/s}$
 $= 770 \times 10^3 \times 60 \text{ J/min}$
 $= (mgh/t)$
 $= (300 \text{ m}^3 \times 1000 \text{ kg/m}^3 \times 9.8 \text{ m/s}^2 \times h)/(1 \text{ min})$

$$\text{Therefore } h = 16 \text{ m}$$

1-9. Volume of water $= (1.2 \times 10^3 \text{ m})^2 \times 3.7 \text{ m} = 5.328 \times 10^6 \text{ m}^3$
Mass of water $= 5.328 \times 10^6 \text{ m}^3 \times 1000 \text{ kg/m}^3 = 5.328 \times 10^9 \text{ kg}$
Centre of mass falls $(3.7/2) \text{ m} = 1.85 \text{ m}$

$$P = \frac{mgh}{t} = \frac{(5.328 \times 10^9 \text{ kg})(9.8 \text{ m/s}^2)(1.85 \text{ m})}{3600 \text{ s}} = 27 \times 10^6 \text{ W}$$

1-10. (b) $v = 90 \frac{\text{km}}{\text{h}} \times 1000 \frac{\text{m}}{\text{km}} \times \frac{1}{3600} \frac{\text{h}}{\text{s}} = 25 \text{ m/s}$

$$\tan \theta = 1/25, \text{ therefore } \theta = 2.29^\circ$$

In one second, the distance traveled is 25 m, and the vertical height climbed is

$$h = (25 \text{ m}) \sin 2.29^\circ = 1.0 \text{ m}$$

$$\text{Power } P = \Delta PE \text{ in 1 sec} = (mgh)/t = (1300 \text{ kg})(9.8 \text{ m/s}^2)(1.0 \text{ m})/(1 \text{ s}) = 13 \times 10^3 \text{ W}$$

1-11. $\frac{\text{Energy}}{\text{area}} = 1.35 \frac{\text{kW}}{\text{m}^2} \times 4 = 5.4 \frac{\text{kW}}{\text{m}^2}$

$$\text{Energy} = 5.4 \frac{\text{kW}}{\text{m}^2} \times 125 \text{ m}^2 \times 24 \text{ h}$$

$$= 1.62 \times 10^4 \text{ kW}\cdot\text{h}$$

$$= 1.62 \times 10^4 \text{ kWh} \times 10^3 \frac{\text{W}}{\text{kW}} \times 3600 \frac{\text{s}}{\text{h}}$$

$$= 5.83 \times 10^{10} \text{ J}$$

CHAPTER 2

2-1. (a) $N = N_0 e^{kt}$

$$k = \ln(1 + R/100) = \ln(1 + 0.012) = 0.012 \text{ yr}^{-1}$$
