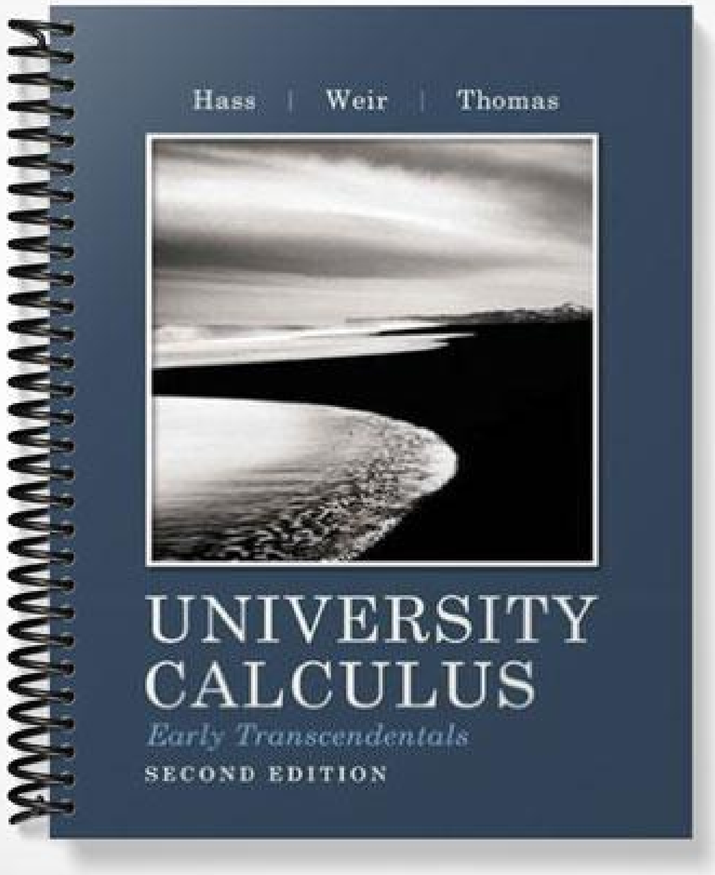
SOLUTIONS MANUAL



CHAPTER 2 LIMITS AND CONTINUITY

2.1 RATES OF CHANGE AND TANGENTS TO CURVES

1. (a) $\frac{\Delta f}{\Delta x} = \frac{f(3)-f(2)}{3-2} = \frac{28-9}{1} = 19$ (b) $\frac{\Delta f}{\Delta x} = \frac{f(1)-f(-1)}{1-(-1)} = \frac{2-0}{2} = 1$

2. (a) $\frac{\Delta g}{\Delta x} = \frac{g(1)-g(-1)}{1-(-1)} = \frac{1-1}{2} = 0$ (b) $\frac{\Delta g}{\Delta x} = \frac{g(0)-g(-2)}{0-(-2)} = \frac{0-4}{2} = -2$

3. (a) $\frac{\Delta h}{\Delta t} = \frac{h\left(\frac{3\pi}{4}\right)-h\left(\frac{\pi}{4}\right)}{\frac{3\pi}{4}-\frac{\pi}{4}} = \frac{-1-1}{\frac{\pi}{2}} = -\frac{4}{\pi}$ (b) $\frac{\Delta h}{\Delta t} = \frac{h\left(\frac{\pi}{2}\right)-h\left(\frac{\pi}{6}\right)}{\frac{\pi}{2}-\frac{\pi}{6}} = \frac{0-\sqrt{3}}{\frac{\pi}{3}} = \frac{-3\sqrt{3}}{\pi}$

4. (a) $\frac{\Delta g}{\Delta t} = \frac{g(\pi)-g(0)}{\pi-0} = \frac{(2-1)-(2+1)}{\pi-0} = -\frac{2}{\pi}$ (b) $\frac{\Delta g}{\Delta t} = \frac{g(\pi)-g(-\pi)}{\pi-(-\pi)} = \frac{(2-1)-(2-1)}{2\pi} = 0$

5. $\frac{\Delta R}{\Delta \theta} = \frac{R(2)-R(0)}{2-0} = \frac{\sqrt{8+1}-\sqrt{1}}{2} = \frac{3-1}{2} = 1$

6. $\frac{\Delta P}{\Delta \theta} = \frac{P(2)-P(1)}{2-1} = \frac{(8-16+10)-(1-4+5)}{1} = 2-2 = 0$

7. (a) $\frac{\Delta y}{\Delta x} = \frac{\left((2+h)^2-3\right)-\left(2^2-3\right)}{h} = \frac{4+4h+h^2-3-1}{h} = \frac{4h+h^2}{h} = 4+h$. As $h \to 0$, $4+h \to 4 \Rightarrow$ at $P(2, 1)$ the slope is 4.
   (b) $y-1 = 4(x-2) \Rightarrow y-1 = 4x-8 \Rightarrow y = 4x-7$

8. (a) $\frac{\Delta y}{\Delta x} = \frac{\left(5-(1+h)^2\right)-\left(5-1^2\right)}{h} = \frac{5-1-2h-h^2-4}{h} = \frac{-2h-h^2}{h} = -2-h$. As $h \to 0$, $-2-h \to -2 \Rightarrow$ at $P(1, 4)$ the slope is -2.
   (b) $y-4 = (-2)(x-1) \Rightarrow y-4 = -2x+2 \Rightarrow y = -2x+6$

9. (a) $\frac{\Delta y}{\Delta x} = \frac{\left((2+h)^2-2(2+h)-3\right)-\left(2^2-2(2)-3\right)}{h} = \frac{4+4h+h^2-4-2h-3-(-3)}{h} = \frac{2h+h^2}{h} = 2+h$. As $h \to 0$, $2+h \to 2 \Rightarrow$ at $P(2, -3)$ the slope is 2.
   (b) $y-(-3) = 2(x-2) \Rightarrow y+3 = 2x-4 \Rightarrow y = 2x-7$.

10. (a) $\frac{\Delta y}{\Delta x} = \frac{\left((1+h)^2-4(1+h)\right)-\left(1^2-4(1)\right)}{h} = \frac{1+2h+h^2-4-4h-(-3)}{h} = \frac{h^2-2h}{h} = h-2$. As $h \to 0$, $h-2 \to -2 \Rightarrow$ at $P(1, -3)$ the slope is -2.
    (b) $y-(-3) = (-2)(x-1) \Rightarrow y+3 = -2x+2 \Rightarrow y = -2x-1$.

11. (a) $\frac{\Delta y}{\Delta x} = \frac{(2+h)^3-2^3}{h} = \frac{8+12h+4h^2+h^3-8}{h} = \frac{12h+4h^2+h^3}{h} = 12+4h+h^2$. As $h \to 0$, $12+4h+h^2 \to 12$, $\Rightarrow$ at $P(2, 8)$ the slope is 12.
    (b) $y-8 = 12(x-2) \Rightarrow y-8 = 12x-24 \Rightarrow y = 12x-16$.

12. (a) $\frac{\Delta y}{\Delta x} = \frac{2-(1+h)^3-\left(2-1^3\right)}{h} = \frac{2-1-3h-3h^2-h^3-1}{h} = \frac{-3h-3h^2-h^3}{h} = -3-3h-h^2$. As $h \to 0$, $-3-3h-h^2 \to -3$, $\Rightarrow$ at $P(1, 1)$ the slope is -3.
    (b) $y-1 = (-3)(x-1) \Rightarrow y-1 = -3x+3 \Rightarrow y = -3x+4$.

13. (a) $\frac{\Delta y}{\Delta x} = \frac{(1+h)^3-12(1+h)-\left(1^3-12(1)\right)}{h} = \frac{1+3h+3h^2+h^3-12-12h-(-11)}{h} = \frac{-9h+3h^2+h^3}{h} = -9+3h+h^2$. As $h \to 0$, $-9+3h+h^2 \to -9 \Rightarrow$ at $P(1, -11)$ the slope is -9.
    (b) $y-(-11) = (-9)(x-1) \Rightarrow y+11 = -9x+9 \Rightarrow y = -9x-2$.

14. (a) $\frac{\Delta y}{\Delta x} = \frac{(2+h)^3 - 3(2+h)^2 + 4 - (2^3 - 3(2)^2 + 4)}{h} = \frac{8 + 12h + 6h^2 + h^3 - 12 - 12h - 3h^2 + 4 - 0}{h} = \frac{3h^2 + h^3}{h} = 3h + h^2$. As $h \to 0$, $3h + h^2 \to 0 \Rightarrow$ at $P(2, 0)$ the slope is 0.

(b) $y - 0 = 0(x - 2) \Rightarrow y = 0$.

15. (a)

Q	Slope of PQ $= \frac{\Delta s}{\Delta t}$
$Q_1(10, 225)$	$\frac{650-225}{20-10} = 42.5$ m/sec
$Q_2(14, 375)$	$\frac{650-375}{20-14} = 45.83$ m/sec
$Q_3(16.5, 475)$	$\frac{650-475}{20-16.5} = 50.00$ m/sec
$Q_4(18, 550)$	$\frac{650-550}{20-18} = 50.00$ m/sec

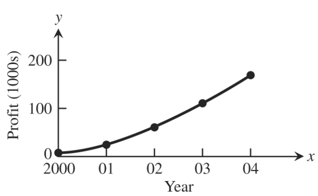
(b) At $t = 20$, the sportscar was traveling approximately 50 m/sec or 180 km/h.

16. (a)

Q	Slope of PQ $= \frac{\Delta y}{\Delta t}$
$Q_1(5, 20)$	$\frac{80-20}{10-5} = 12$ m/sec
$Q_2(7, 39)$	$\frac{80-39}{10-7} = 13.7$ m/sec
$Q_3(8.5, 58)$	$\frac{80-58}{10-8.5} = 14.7$ m/sec
$Q_4(9.5, 72)$	$\frac{80-72}{10-9.5} = 16$ m/sec

(b) Approximately 16 m/sec

17. (a)



(b) $\frac{\Delta p}{\Delta t} = \frac{174-62}{2004-2002} = \frac{112}{2} = 56$ thousand dollars per year

(c) The average rate of change from 2001 to 2002 is $\frac{\Delta p}{\Delta t} = \frac{62-27}{20022-2001} = 35$ thousand dollars per year.

The average rate of change from 2002 to 2003 is $\frac{\Delta p}{\Delta t} = \frac{111-62}{2003-2002} = 49$ thousand dollars per year.

So, the rate at which profits were changing in 2002 is approximatley $\frac{1}{2}(35 + 49) = 42$ thousand dollars per year.

18. (a) $F(x) = (x+2)/(x-2)$

x	1.2	1.1	1.01	1.001	1.0001	1
F(x)	-4.0	$-3.\overline{4}$	$-3.\overline{04}$	$-3.\overline{004}$	$-3.\overline{0004}$	-3

$\frac{\Delta F}{\Delta x} = \frac{-4.0-(-3)}{1.2-1} = -5.0$; $\frac{\Delta F}{\Delta x} = \frac{-3.\overline{4}-(-3)}{1.1-1} = -4.\overline{4}$;

$\frac{\Delta F}{\Delta x} = \frac{-3.\overline{04}-(-3)}{1.01-1} = -4.\overline{04}$; $\frac{\Delta F}{\Delta x} = \frac{-3.\overline{004}-(-3)}{1.001-1} = -4.\overline{004}$;

$\frac{\Delta F}{\Delta x} = \frac{-3.\overline{0004}-(-3)}{1.0001-1} = -4.\overline{0004}$;

(b) The rate of change of F(x) at $x = 1$ is -4.

19. (a) $\frac{\Delta g}{\Delta x} = \frac{g(2)-g(1)}{2-1} = \frac{\sqrt{2}-1}{2-1} \approx 0.414213$ $\frac{\Delta g}{\Delta x} = \frac{g(1.5)-g(1)}{1.5-1} = \frac{\sqrt{1.5}-1}{0.5} \approx 0.449489$

$\frac{\Delta g}{\Delta x} = \frac{g(1+h)-g(1)}{(1+h)-1} = \frac{\sqrt{1+h}-1}{h}$

(b) $g(x) = \sqrt{x}$

$1+h$	1.1	1.01	1.001	1.0001	1.00001	1.000001
$\sqrt{1+h}$	1.04880	1.004987	1.0004998	1.0000499	1.000005	1.0000005
$\left(\sqrt{1+h}-1\right)/h$	0.4880	0.4987	0.4998	0.499	0.5	0.5

(c) The rate of change of g(x) at x = 1 is 0.5.

(d) The calculator gives $\lim\limits_{h \to 0} \frac{\sqrt{1+h}-1}{h} = \frac{1}{2}$.

20. (a) i) $\frac{f(3)-f(2)}{3-2} = \frac{\frac{1}{3}-\frac{1}{2}}{1} = \frac{\frac{-1}{6}}{1} = -\frac{1}{6}$

ii) $\frac{f(T)-f(2)}{T-2} = \frac{\frac{1}{T}-\frac{1}{2}}{T-2} = \frac{\frac{2}{2T}-\frac{T}{2T}}{T-2} = \frac{2-T}{2T(T-2)} = \frac{2-T}{-2T(2-T)} = -\frac{1}{2T}, T \neq 2$

(b)

T	2.1	2.01	2.001	2.0001	2.00001	2.000001
f(T)	0.476190	0.497512	0.499750	0.4999750	0.499997	0.499999
(f(T) − f(2))/(T − 2)	−0.2381	−0.2488	−0.2500	−0.2500	−0.2500	−0.2500

(c) The table indicates the rate of change is −0.25 at t = 2.

(d) $\lim\limits_{T \to 2} \left(\frac{1}{-2T}\right) = -\frac{1}{4}$

NOTE: Answers will vary in Exercises 21 and 22.

21. (a) $[0, 1]$: $\frac{\Delta s}{\Delta t} = \frac{15-0}{1-0} = 15$ mph; $[1, 2.5]$: $\frac{\Delta s}{\Delta t} = \frac{20-15}{2.5-1} = \frac{10}{3}$ mph; $[2.5, 3.5]$: $\frac{\Delta s}{\Delta t} = \frac{30-20}{3.5-2.5} = 10$ mph

(b) At $P\left(\frac{1}{2}, 7.5\right)$: Since the portion of the graph from t = 0 to t = 1 is nearly linear, the instantaneous rate of change will be almost the same as the average rate of change, thus the instantaneous speed at $t = \frac{1}{2}$ is $\frac{15-7.5}{1-0.5} = 15$ mi/hr.

At P(2, 20): Since the portion of the graph from t = 2 to t = 2.5 is nearly linear, the instantaneous rate of change will be nearly the same as the average rate of change, thus $v = \frac{20-20}{2.5-2} = 0$ mi/hr. For values of t less than 2, we have

Q	Slope of PQ = $\frac{\Delta s}{\Delta t}$
$Q_1(1, 15)$	$\frac{15-20}{1-2} = 5$ mi/hr
$Q_2(1.5, 19)$	$\frac{19-20}{1.5-2} = 2$ mi/hr
$Q_3(1.9, 19.9)$	$\frac{19.9-20}{1.9-2} = 1$ mi/hr

Thus, it appears that the instantaneous speed at t = 2 is 0 mi/hr.

At P(3, 22):

Q	Slope of PQ = $\frac{\Delta s}{\Delta t}$
$Q_1(4, 35)$	$\frac{35-22}{4-3} = 13$ mi/hr
$Q_2(3.5, 30)$	$\frac{30-22}{3.5-3} = 16$ mi/hr
$Q_3(3.1, 23)$	$\frac{23-22}{3.1-3} = 10$ mi/hr

Q	Slope of PQ = $\frac{\Delta s}{\Delta t}$
$Q_1(2, 20)$	$\frac{20-22}{2-3} = 2$ mi/hr
$Q_2(2.5, 20)$	$\frac{20-22}{2.5-3} = 4$ mi/hr
$Q_3(2.9, 21.6)$	$\frac{21.6-22}{2.9-3} = 4$ mi/hr

Thus, it appears that the instantaneous speed at t = 3 is about 7 mi/hr.

(c) It appears that the curve is increasing the fastest at t = 3.5. Thus for P(3.5, 30)

Q	Slope of PQ = $\frac{\Delta s}{\Delta t}$
$Q_1(4, 35)$	$\frac{35-30}{4-3.5} = 10$ mi/hr
$Q_2(3.75, 34)$	$\frac{34-30}{3.75-3.5} = 16$ mi/hr
$Q_3(3.6, 32)$	$\frac{32-30}{3.6-3.5} = 20$ mi/hr

Q	Slope of PQ = $\frac{\Delta s}{\Delta t}$
$Q_1(3, 22)$	$\frac{22-30}{3-3.5} = 16$ mi/hr
$Q_2(3.25, 25)$	$\frac{25-30}{3.25-3.5} = 20$ mi/hr
$Q_3(3.4, 28)$	$\frac{28-30}{3.4-3.5} = 20$ mi/hr

Thus, it appears that the instantaneous speed at t = 3.5 is about 20 mi/hr.

22. (a) $[0, 3]$: $\frac{\Delta A}{\Delta t} = \frac{10-15}{3-0} \approx -1.67 \frac{\text{gal}}{\text{day}}$; $[0, 5]$: $\frac{\Delta A}{\Delta t} = \frac{3.9-15}{5-0} \approx -2.2 \frac{\text{gal}}{\text{day}}$; $[7, 10]$: $\frac{\Delta A}{\Delta t} = \frac{0-1.4}{10-7} \approx -0.5 \frac{\text{gal}}{\text{day}}$

(b) At P(1, 14):

Q	Slope of PQ = $\frac{\Delta A}{\Delta t}$
$Q_1(2, 12.2)$	$\frac{12.2-14}{2-1} = -1.8$ gal/day
$Q_2(1.5, 13.2)$	$\frac{13.2-14}{1.5-1} = -1.6$ gal/day
$Q_3(1.1, 13.85)$	$\frac{13.85-14}{1.1-1} = -1.5$ gal/day

Q	Slope of PQ = $\frac{\Delta A}{\Delta t}$
$Q_1(0, 15)$	$\frac{15-14}{0-1} = -1$ gal/day
$Q_2(0.5, 14.6)$	$\frac{14.6-14}{0.5-1} = -1.2$ gal/day
$Q_3(0.9, 14.86)$	$\frac{14.86-14}{0.9-1} = -1.4$ gal/day

Thus, it appears that the instantaneous rate of consumption at t = 1 is about −1.45 gal/day.

At P(4, 6):

Q	Slope of PQ $= \frac{\Delta A}{\Delta t}$	Q	Slope of PQ $= \frac{\Delta A}{\Delta t}$
$Q_1(5, 3.9)$	$\frac{3.9-6}{5-4} = -2.1$ gal/day	$Q_1(3, 10)$	$\frac{10-6}{3-4} = -4$ gal/day
$Q_2(4.5, 4.8)$	$\frac{4.8-6}{4.5-4} = -2.4$ gal/day	$Q_2(3.5, 7.8)$	$\frac{7.8-6}{3.5-4} = -3.6$ gal/day
$Q_3(4.1, 5.7)$	$\frac{5.7-6}{4.1-4} = -3$ gal/day	$Q_3(3.9, 6.3)$	$\frac{6.3-6}{3.9-4} = -3$ gal/day

Thus, it appears that the instantaneous rate of consumption at $t = 1$ is -3 gal/day.

At P(8, 1):

Q	Slope of PQ $= \frac{\Delta A}{\Delta t}$	Q	Slope of PQ $= \frac{\Delta A}{\Delta t}$
$Q_1(9, 0.5)$	$\frac{0.5-1}{9-8} = -0.5$ gal/day	$Q_1(7, 1.4)$	$\frac{1.4-1}{7-8} = -0.6$ gal/day
$Q_2(8.5, 0.7)$	$\frac{0.7-1}{8.5-8} = -0.6$ gal/day	$Q_2(7.5, 1.3)$	$\frac{1.3-1}{7.5-8} = -0.6$ gal/day
$Q_3(8.1, 0.95)$	$\frac{0.95-1}{8.1-8} = -0.5$ gal/day	$Q_3(7.9, 1.04)$	$\frac{1.04-1}{7.9-8} = -0.6$ gal/day

Thus, it appears that the instantaneous rate of consumption at $t = 1$ is -0.55 gal/day.

(c) It appears that the curve (the consumption) is decreasing the fastest at $t = 3.5$. Thus for $P(3.5, 7.8)$

Q	Slope of PQ $= \frac{\Delta A}{\Delta t}$	Q	Slope of PQ $= \frac{\Delta s}{\Delta t}$
$Q_1(4.5, 4.8)$	$\frac{4.8-7.8}{4.5-3.5} = -3$ gal/day	$Q_1(2.5, 11.2)$	$\frac{11.2-7.8}{2.5-3.5} = -3.4$ gal/day
$Q_2(4, 6)$	$\frac{6-7.8}{4-3.5} = -3.6$ gal/day	$Q_2(3, 10)$	$\frac{10-7.8}{3-3.5} = -4.4$ gal/day
$Q_3(3.6, 7.4)$	$\frac{7.4-7.8}{3.6-3.5} = -4$ gal/day	$Q_3(3.4, 8.2)$	$\frac{8.2-7.8}{3.4-3.5} = -4$ gal/day

Thus, it appears that the rate of consumption at $t = 3.5$ is about -4 gal/day.

2.2 LIMIT OF A FUNCTION AND LIMIT LAWS

1. (a) Does not exist. As x approaches 1 from the right, g(x) approaches 0. As x approaches 1 from the left, g(x) approaches 1. There is no single number L that all the values g(x) get arbitrarily close to as $x \to 1$.
   (b) 1 (c) 0 (d) 0.5

2. (a) 0
   (b) -1
   (c) Does not exist. As t approaches 0 from the left, f(t) approaches -1. As t approaches 0 from the right, f(t) approaches 1. There is no single number L that f(t) gets arbitrarily close to as $t \to 0$.
   (d) -1

3. (a) True (b) True (c) False
   (d) False (e) False (f) True
   (g) True

4. (a) False (b) False (c) True
   (d) True (e) True

5. $\lim\limits_{x \to 0} \frac{x}{|x|}$ does not exist because $\frac{x}{|x|} = \frac{x}{x} = 1$ if $x > 0$ and $\frac{x}{|x|} = \frac{x}{-x} = -1$ if $x < 0$. As x approaches 0 from the left, $\frac{x}{|x|}$ approaches -1. As x approaches 0 from the right, $\frac{x}{|x|}$ approaches 1. There is no single number L that all the function values get arbitrarily close to as $x \to 0$.

6. As x approaches 1 from the left, the values of $\frac{1}{x-1}$ become increasingly large and negative. As x approaches 1 from the right, the values become increasingly large and positive. There is no one number L that all the function values get arbitrarily close to as $x \to 1$, so $\lim\limits_{x \to 1} \frac{1}{x-1}$ does not exist.

7. Nothing can be said about f(x) because the existence of a limit as $x \to x_0$ does not depend on how the function is defined at x_0. In order for a limit to exist, f(x) must be arbitrarily close to a single real number L when x is close enough to x_0. That is, the existence of a limit depends on the values of f(x) for x near x_0, not on the definition of f(x) at x_0 itself.

8. Nothing can be said. In order for $\lim\limits_{x \to 0} f(x)$ to exist, f(x) must close to a single value for x near 0 regardless of the value f(0) itself.

9. No, the definition does not require that f be defined at $x = 1$ in order for a limiting value to exist there. If f(1) is defined, it can be any real number, so we can conclude nothing about f(1) from $\lim\limits_{x \to 1} f(x) = 5$.

10. No, because the existence of a limit depends on the values of f(x) when x is near 1, not on f(1) itself. If $\lim\limits_{x \to 1} f(x)$ exists, its value may be some number other than $f(1) = 5$. We can conclude nothing about $\lim\limits_{x \to 1} f(x)$, whether it exists or what its value is if it does exist, from knowing the value of f(1) alone.

11. $\lim\limits_{x \to -7} (2x + 5) = 2(-7) + 5 = -14 + 5 = -9$

12. $\lim\limits_{x \to 2} (-x^2 + 5x - 2) = -(2)^2 + 5(2) - 2 = -4 + 10 - 2 = 4$

13. $\lim\limits_{t \to 6} 8(t - 5)(t - 7) = 8(6 - 5)(6 - 7) = -8$

14. $\lim\limits_{x \to -2} (x^3 - 2x^2 + 4x + 8) = (-2)^3 - 2(-2)^2 + 4(-2) + 8 = -8 - 8 - 8 + 8 = -16$

15. $\lim\limits_{x \to 2} \frac{x+3}{x+6} = \frac{2+3}{2+6} = \frac{5}{8}$

16. $\lim\limits_{s \to \frac{2}{3}} 3s(2s - 1) = 3\left(\frac{2}{3}\right)\left[2\left(\frac{2}{3}\right) - 1\right] = 2\left(\frac{4}{3} - 1\right) = \frac{2}{3}$

17. $\lim\limits_{x \to -1} 3(2x - 1)^2 = 3(2(-1) - 1)^2 = 3(-3)^2 = 27$

18. $\lim\limits_{y \to 2} \frac{y+2}{y^2+5y+6} = \frac{2+2}{(2)^2+5(2)+6} = \frac{4}{4+10+6} = \frac{4}{20} = \frac{1}{5}$

19. $\lim\limits_{y \to -3} (5 - y)^{4/3} = [5 - (-3)]^{4/3} = (8)^{4/3} = \left((8)^{1/3}\right)^4 = 2^4 = 16$

20. $\lim\limits_{z \to 0} (2z - 8)^{1/3} = (2(0) - 8)^{1/3} = (-8)^{1/3} = -2$

21. $\lim\limits_{h \to 0} \frac{3}{\sqrt{3h+1}+1} = \frac{3}{\sqrt{3(0)+1}+1} = \frac{3}{\sqrt{1}+1} = \frac{3}{2}$

22. $\lim\limits_{h \to 0} \frac{\sqrt{5h+4}-2}{h} = \lim\limits_{h \to 0} \frac{\sqrt{5h+4}-2}{h} \cdot \frac{\sqrt{5h+4}+2}{\sqrt{5h+4}+2} = \lim\limits_{h \to 0} \frac{(5h+4)-4}{h\left(\sqrt{5h+4}+2\right)} = \lim\limits_{h \to 0} \frac{5h}{h\left(\sqrt{5h+4}+2\right)} = \lim\limits_{h \to 0} \frac{5}{\sqrt{5h+4}+2}$
$= \frac{5}{\sqrt{4}+2} = \frac{5}{4}$

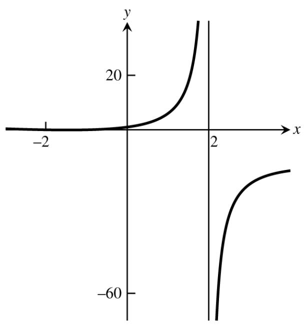
x	-2.1	-2.01	-2.001	-2.0001	-2.00001	-2.000001
F(x)	-1.1	-1.01	-1.001	-1.0001	-1.00001	-1.000001

x	-1.9	-1.99	-1.999	-1.9999	-1.99999	-1.999999
F(x)	$-.9$	$-.99$	$-.999$	$-.9999$	$-.99999$	$-.999999$

(b)



$F(x) = (x^2 + 3x + 2)/(2 - |x|)$

(c) $F(x) = \frac{x^2+3x+2}{2-|x|} = \begin{cases} \frac{(x+2)(x+1)}{2-x}, & x \geq 0 \\ \frac{(x+2)(x+1)}{2+x} = x+1, & x < 0 \text{ and } x \neq -2 \end{cases}$, and $\lim_{x \to -2} (x+1) = -2 + 1 = -1.$

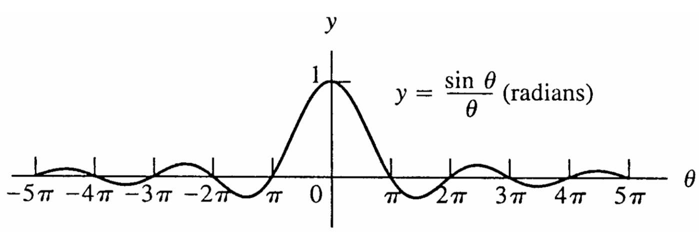
73. (a) $g(\theta) = (\sin \theta)/\theta$

θ	.1	.01	.001	.0001	.00001	.000001
$g(\theta)$	.998334	.999983	.999999	.999999	.999999	.999999

θ	$-.1$	$-.01$	$-.001$	$-.0001$	$-.00001$	$-.000001$
$g(\theta)$	.998334	.999983	.999999	.999999	.999999	.999999

$\lim_{\theta \to 0} g(\theta) = 1$

(b)



NOT TO SCALE

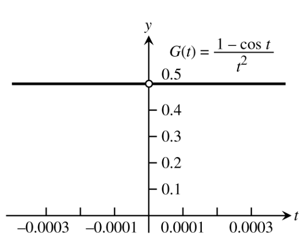
74. (a) $G(t) = (1 - \cos t)/t^2$

t	.1	.01	.001	.0001	.00001	.000001
G(t)	.499583	.499995	.499999	.5	.5	.5

t	$-.1$	$-.01$	$-.001$	$-.0001$	$-.00001$	$-.000001$
G(t)	.499583	.499995	.499999	.5	.5	.5

$\lim_{t \to 0} G(t) = 0.5$

(b)



Graph is NOT TO SCALE

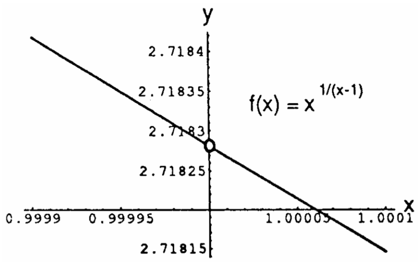
75. (a) $f(x) = x^{1/(1-x)}$

x	.9	.99	.999	.9999	.99999	.999999
f(x)	.348678	.366032	.367695	.367861	.367877	.367879

x	1.1	1.01	1.001	1.0001	1.00001	1.000001
f(x)	.385543	.369711	.368063	.367897	.367881	.367878

$\lim_{x \to 1} f(x) \approx 0.36788$

(b)



Graph is NOT TO SCALE. Also the intersection of the axes is not the origin: the axes intersect at the point $(1, 2.71820)$.

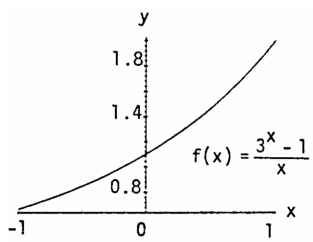
76. (a) $f(x) = (3^x - 1)/x$

x	.1	.01	.001	.0001	.00001	.000001
f(x)	1.161231	1.104669	1.099215	1.098672	1.098618	1.098612

x	$-.1$	$-.01$	$-.001$	$-.0001$	$-.00001$	$-.000001$
f(x)	1.040415	1.092599	1.098009	1.098551	1.098606	1.098611

$\lim_{x \to 0} f(x) \approx 1.0986$

(b)



77. $\lim_{x \to c} f(x)$ exists at those points c where $\lim_{x \to c} x^4 = \lim_{x \to c} x^2$. Thus, $c^4 = c^2 \Rightarrow c^2(1 - c^2) = 0 \Rightarrow c = 0, 1$, or -1.

Moreover, $\lim_{x \to 0} f(x) = \lim_{x \to 0} x^2 = 0$ and $\lim_{x \to -1} f(x) = \lim_{x \to 1} f(x) = 1$.

78. Nothing can be concluded about the values of f, g, and h at $x = 2$. Yes, f(2) could be 0. Since the conditions of the sandwich theorem are satisfied, $\lim_{x \to 2} f(x) = -5 \neq 0$.

79. $1 = \lim_{x \to 4} \frac{f(x)-5}{x-2} = \frac{\lim_{x\to 4} f(x) - \lim_{x\to 4} 5}{\lim_{x\to 4} x - \lim_{x\to 4} 2} = \frac{\lim_{x\to 4} f(x) - 5}{4-2} \Rightarrow \lim_{x \to 4} f(x) - 5 = 2(1) \Rightarrow \lim_{x \to 4} f(x) = 2 + 5 = 7.$

80. (a) $1 = \lim_{x \to -2} \frac{f(x)}{x^2} = \frac{\lim_{x\to -2} f(x)}{\lim_{x\to -2} x^2} = \frac{\lim_{x\to -2} f(x)}{4} \Rightarrow \lim_{x \to -2} f(x) = 4.$

(b) $1 = \lim_{x \to -2} \frac{f(x)}{x^2} = \left[\lim_{x \to -2} \frac{f(x)}{x}\right]\left[\lim_{x \to -2} \frac{1}{x}\right] = \left[\lim_{x \to -2} \frac{f(x)}{x}\right]\left(\frac{1}{-2}\right) \Rightarrow \lim_{x \to -2} \frac{f(x)}{x} = -2.$

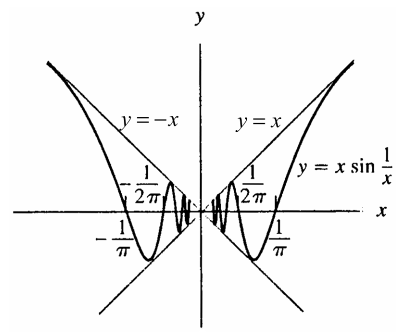
81. (a) $0 = 3 \cdot 0 = \left[\lim\limits_{x \to 2} \frac{f(x)-5}{x-2}\right]\left[\lim\limits_{x \to 2} (x-2)\right] = \lim\limits_{x \to 2} \left[\left(\frac{f(x)-5}{x-2}\right)(x-2)\right] = \lim\limits_{x \to 2} [f(x)-5] = \lim\limits_{x \to 2} f(x) - 5$
$\Rightarrow \lim\limits_{x \to 2} f(x) = 5.$

(b) $0 = 4 \cdot 0 = \left[\lim\limits_{x \to 2} \frac{f(x)-5}{x-2}\right]\left[\lim\limits_{x \to 2} (x-2)\right] \Rightarrow \lim\limits_{x \to 2} f(x) = 5$ as in part (a).

82. (a) $0 = 1 \cdot 0 = \left[\lim\limits_{x \to 0} \frac{f(x)}{x^2}\right]\left[\lim\limits_{x \to 0} x\right]^2 = \left[\lim\limits_{x \to 0} \frac{f(x)}{x^2}\right]\left[\lim\limits_{x \to 0} x^2\right] = \lim\limits_{x \to 0} \left[\frac{f(x)}{x^2} \cdot x^2\right] = \lim\limits_{x \to 0} f(x).$ That is, $\lim\limits_{x \to 0} f(x) = 0.$

(b) $0 = 1 \cdot 0 = \left[\lim\limits_{x \to 0} \frac{f(x)}{x^2}\right]\left[\lim\limits_{x \to 0} x\right] = \lim\limits_{x \to 0} \left[\frac{f(x)}{x^2} \cdot x\right] = \lim\limits_{x \to 0} \frac{f(x)}{x}.$ That is, $\lim\limits_{x \to 0} \frac{f(x)}{x} = 0.$

83. (a) $\lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$

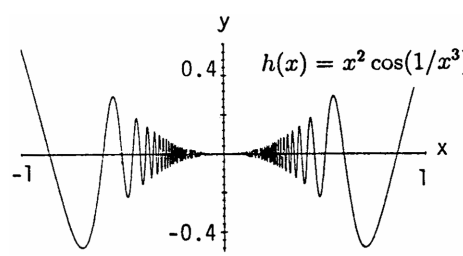


(b) $-1 \le \sin \frac{1}{x} \le 1$ for $x \ne 0$:

$x > 0 \Rightarrow -x \le x \sin \frac{1}{x} \le x \Rightarrow \lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$ by the sandwich theorem;

$x < 0 \Rightarrow -x \ge x \sin \frac{1}{x} \ge x \Rightarrow \lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$ by the sandwich theorem.

84. (a) $\lim\limits_{x \to 0} x^2 \cos\left(\frac{1}{x^3}\right) = 0$



(b) $-1 \le \cos\left(\frac{1}{x^3}\right) \le 1$ for $x \ne 0 \Rightarrow -x^2 \le x^2 \cos\left(\frac{1}{x^3}\right) \le x^2 \Rightarrow \lim\limits_{x \to 0} x^2 \cos\left(\frac{1}{x^3}\right) = 0$ by the sandwich theorem since $\lim\limits_{x \to 0} x^2 = 0$.

85-90. Example CAS commands:

Maple:

```
f := x -> (x^4 − 16)/(x − 2);
x0 := 2;
plot( f(x), x = x0-1..x0+1, color = black,
     title = "Section 2.2, #85(a)" );
limit( f(x), x = x0 );
```

In Exercise 87, note that the standard cube root, x^(1/3), is not defined for $x < 0$ in many CASs. This can be overcome in Maple by entering the function as f := x -> (surd(x+1, 3) − 1)/x.

Mathematica: (assigned function and values for x0 and h may vary)

```
Clear[f, x]
f[x_]:=(x^3 − x^2 − 5x − 3)/(x + 1)^2
x0= −1; h= 0.1;
```

Plot[f[x],{x, x0 − h, x0 + h}]
Limit[f[x], x → x0]

2.3 THE PRECISE DEFINITION OF A LIMIT

1. 
Step 1: $|x-5|<\delta \Rightarrow -\delta<x-5<\delta \Rightarrow -\delta+5<x<\delta+5$

Step 2: $\delta+5=7 \Rightarrow \delta=2$, or $-\delta+5=1 \Rightarrow \delta=4$.

The value of δ which assures $|x-5|<\delta \Rightarrow 1<x<7$ is the smaller value, $\delta=2$.

2. 

Step 1: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$

Step 2: $-\delta+2=1 \Rightarrow \delta=1$, or $\delta+2=7 \Rightarrow \delta=5$.

The value of δ which assures $|x-2|<\delta \Rightarrow 1<x<7$ is the smaller value, $\delta=1$.

3. 
Step 1: $|x-(-3)|<\delta \Rightarrow -\delta<x+3<\delta \Rightarrow -\delta-3<x<\delta-3$

Step 2: $-\delta-3=-\frac{7}{2} \Rightarrow \delta=\frac{1}{2}$, or $\delta-3=-\frac{1}{2} \Rightarrow \delta=\frac{5}{2}$.

The value of δ which assures $|x-(-3)|<\delta \Rightarrow -\frac{7}{2}<x<-\frac{1}{2}$ is the smaller value, $\delta=\frac{1}{2}$.

4. 
Step 1: $\left|x-\left(-\frac{3}{2}\right)\right|<\delta \Rightarrow -\delta<x+\frac{3}{2}<\delta \Rightarrow -\delta-\frac{3}{2}<x<\delta-\frac{3}{2}$

Step 2: $-\delta-\frac{3}{2}=-\frac{7}{2} \Rightarrow \delta=2$, or $\delta-\frac{3}{2}=-\frac{1}{2} \Rightarrow \delta=1$.

The value of δ which assures $\left|x-\left(-\frac{3}{2}\right)\right|<\delta \Rightarrow -\frac{7}{2}<x<-\frac{1}{2}$ is the smaller value, $\delta=1$.

5. 
Step 1: $\left|x-\frac{1}{2}\right|<\delta \Rightarrow -\delta<x-\frac{1}{2}<\delta \Rightarrow -\delta+\frac{1}{2}<x<\delta+\frac{1}{2}$

Step 2: $-\delta+\frac{1}{2}=\frac{4}{9} \Rightarrow \delta=\frac{1}{18}$, or $\delta+\frac{1}{2}=\frac{4}{7} \Rightarrow \delta=\frac{1}{14}$.

The value of δ which assures $\left|x-\frac{1}{2}\right|<\delta \Rightarrow \frac{4}{9}<x<\frac{4}{7}$ is the smaller value, $\delta=\frac{1}{18}$.

6. 
Step 1: $|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$

Step 2: $-\delta+3=2.7591 \Rightarrow \delta=0.2409$, or $\delta+3=3.2391 \Rightarrow \delta=0.2391$.

The value of δ which assures $|x-3|<\delta \Rightarrow 2.7591<x<3.2391$ is the smaller value, $\delta=0.2391$.

7. Step 1: $|x-5|<\delta \Rightarrow -\delta<x-5<\delta \Rightarrow -\delta+5<x<\delta+5$

Step 2: From the graph, $-\delta+5=4.9 \Rightarrow \delta=0.1$, or $\delta+5=5.1 \Rightarrow \delta=0.1$; thus $\delta=0.1$ in either case.

8. Step 1: $|x-(-3)|<\delta \Rightarrow -\delta<x+3<\delta \Rightarrow -\delta-3<x<\delta-3$

Step 2: From the graph, $-\delta-3=-3.1 \Rightarrow \delta=0.1$, or $\delta-3=-2.9 \Rightarrow \delta=0.1$; thus $\delta=0.1$.

9. Step 1: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow -\delta+1<x<\delta+1$
Step 2: From the graph, $-\delta+1=\frac{9}{16} \Rightarrow \delta=\frac{7}{16}$, or $\delta+1=\frac{25}{16} \Rightarrow \delta=\frac{9}{16}$; thus $\delta=\frac{7}{16}$.

10. Step 1: $|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$
Step 2: From the graph, $-\delta+3=2.61 \Rightarrow \delta=0.39$, or $\delta+3=3.41 \Rightarrow \delta=0.41$; thus $\delta=0.39$.

11. Step 1: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$
Step 2: From the graph, $-\delta+2=\sqrt{3} \Rightarrow \delta=2-\sqrt{3}\approx 0.2679$, or $\delta+2=\sqrt{5} \Rightarrow \delta=\sqrt{5}-2\approx 0.2361$; thus $\delta=\sqrt{5}-2$.

12. Step 1: $|x-(-1)|<\delta \Rightarrow -\delta<x+1<\delta \Rightarrow -\delta-1<x<\delta-1$
Step 2: From the graph, $-\delta-1=-\frac{\sqrt{5}}{2} \Rightarrow \delta=\frac{\sqrt{5}-2}{2}\approx 0.1180$, or $\delta-1=-\frac{\sqrt{3}}{2} \Rightarrow \delta=\frac{2-\sqrt{3}}{2}\approx 0.1340$; thus $\delta=\frac{\sqrt{5}-2}{2}$.

13. Step 1: $|x-(-1)|<\delta \Rightarrow -\delta<x+1<\delta \Rightarrow -\delta-1<x<\delta-1$
Step 2: From the graph, $-\delta-1=-\frac{16}{9} \Rightarrow \delta=\frac{7}{9}\approx 0.77$, or $\delta-1=-\frac{16}{25} \Rightarrow \frac{9}{25}=0.36$; thus $\delta=\frac{9}{25}=0.36$.

14. Step 1: $\left|x-\frac{1}{2}\right|<\delta \Rightarrow -\delta<x-\frac{1}{2}<\delta \Rightarrow -\delta+\frac{1}{2}<x<\delta+\frac{1}{2}$
Step 2: From the graph, $-\delta+\frac{1}{2}=\frac{1}{2.01} \Rightarrow \delta=\frac{1}{2}-\frac{1}{2.01}\approx 0.00248$, or $\delta+\frac{1}{2}=\frac{1}{1.99} \Rightarrow \delta=\frac{1}{1.99}-\frac{1}{2}\approx 0.00251$; thus $\delta=0.00248$.

15. Step 1: $|(x+1)-5|<0.01 \Rightarrow |x-4|<0.01 \Rightarrow -0.01<x-4<0.01 \Rightarrow 3.99<x<4.01$
Step 2: $|x-4|<\delta \Rightarrow -\delta<x-4<\delta \Rightarrow -\delta+4<x<\delta+4 \Rightarrow \delta=0.01$.

16. Step 1: $|(2x-2)-(-6)|<0.02 \Rightarrow |2x+4|<0.02 \Rightarrow -0.02<2x+4<0.02 \Rightarrow -4.02<2x<-3.98$
$\Rightarrow -2.01<x<-1.99$
Step 2: $|x-(-2)|<\delta \Rightarrow -\delta<x+2<\delta \Rightarrow -\delta-2<x<\delta-2 \Rightarrow \delta=0.01$.

17. Step 1: $\left|\sqrt{x+1}-1\right|<0.1 \Rightarrow -0.1<\sqrt{x+1}-1<0.1 \Rightarrow 0.9<\sqrt{x+1}<1.1 \Rightarrow 0.81<x+1<1.21$
$\Rightarrow -0.19<x<0.21$
Step 2: $|x-0|<\delta \Rightarrow -\delta<x<\delta$. Then, $-\delta=-0.19 \Rightarrow \delta=0.19$ or $\delta=0.21$; thus, $\delta=0.19$.

18. Step 1: $\left|\sqrt{x}-\frac{1}{2}\right|<0.1 \Rightarrow -0.1<\sqrt{x}-\frac{1}{2}<0.1 \Rightarrow 0.4<\sqrt{x}<0.6 \Rightarrow 0.16<x<0.36$
Step 2: $\left|x-\frac{1}{4}\right|<\delta \Rightarrow -\delta<x-\frac{1}{4}<\delta \Rightarrow -\delta+\frac{1}{4}<x<\delta+\frac{1}{4}$.
Then, $-\delta+\frac{1}{4}=0.16 \Rightarrow \delta=0.09$ or $\delta+\frac{1}{4}=0.36 \Rightarrow \delta=0.11$; thus $\delta=0.09$.

19. Step 1: $\left|\sqrt{19-x}-3\right|<1 \Rightarrow -1<\sqrt{19-x}-3<1 \Rightarrow 2<\sqrt{19-x}<4 \Rightarrow 4<19-x<16$
$\Rightarrow -4>x-19>-16 \Rightarrow 15>x>3$ or $3<x<15$
Step 2: $|x-10|<\delta \Rightarrow -\delta<x-10<\delta \Rightarrow -\delta+10<x<\delta+10$.
Then $-\delta+10=3 \Rightarrow \delta=7$, or $\delta+10=15 \Rightarrow \delta=5$; thus $\delta=5$.

20. Step 1: $\left|\sqrt{x-7}-4\right|<1 \Rightarrow -1<\sqrt{x-7}-4<1 \Rightarrow 3<\sqrt{x-7}<5 \Rightarrow 9<x-7<25 \Rightarrow 16<x<32$
Step 2: $|x-23|<\delta \Rightarrow -\delta<x-23<\delta \Rightarrow -\delta+23<x<\delta+23$.
Then $-\delta+23=16 \Rightarrow \delta=7$, or $\delta+23=32 \Rightarrow \delta=9$; thus $\delta=7$.

21. Step 1: $\left|\frac{1}{x}-\frac{1}{4}\right| < 0.05 \Rightarrow -0.05 < \frac{1}{x}-\frac{1}{4} < 0.05 \Rightarrow 0.2 < \frac{1}{x} < 0.3 \Rightarrow \frac{10}{2} > x > \frac{10}{3}$ or $\frac{10}{3} < x < 5$.
Step 2: $|x-4| < \delta \Rightarrow -\delta < x-4 < \delta \Rightarrow -\delta+4 < x < \delta+4$.
Then $-\delta+4=\frac{10}{3}$ or $\delta=\frac{2}{3}$, or $\delta+4=5$ or $\delta=1$; thus $\delta=\frac{2}{3}$.

22. Step 1: $|x^2-3| < 0.1 \Rightarrow -0.1 < x^2-3 < 0.1 \Rightarrow 2.9 < x^2 < 3.1 \Rightarrow \sqrt{2.9} < x < \sqrt{3.1}$
Step 2: $\left|x-\sqrt{3}\right| < \delta \Rightarrow -\delta < x-\sqrt{3} < \delta \Rightarrow -\delta+\sqrt{3} < x < \delta+\sqrt{3}$.
Then $-\delta+\sqrt{3}=\sqrt{2.9} \Rightarrow \delta=\sqrt{3}-\sqrt{2.9}\approx 0.0291$, or $\delta+\sqrt{3}=\sqrt{3.1} \Rightarrow \delta=\sqrt{3.1}-\sqrt{3}\approx 0.0286$; thus $\delta=0.0286$.

23. Step 1: $|x^2-4| < 0.5 \Rightarrow -0.5 < x^2-4 < 0.5 \Rightarrow 3.5 < x^2 < 4.5 \Rightarrow \sqrt{3.5} < |x| < \sqrt{4.5} \Rightarrow -\sqrt{4.5} < x < -\sqrt{3.5}$, for x near -2.
Step 2: $|x-(-2)| < \delta \Rightarrow -\delta < x+2 < \delta \Rightarrow -\delta-2 < x < \delta-2$.
Then $-\delta-2=-\sqrt{4.5} \Rightarrow \delta=\sqrt{4.5}-2\approx 0.1213$, or $\delta-2=-\sqrt{3.5} \Rightarrow \delta=2-\sqrt{3.5}\approx 0.1292$; thus $\delta=\sqrt{4.5}-2\approx 0.12$.

24. Step 1: $\left|\frac{1}{x}-(-1)\right| < 0.1 \Rightarrow -0.1 < \frac{1}{x}+1 < 0.1 \Rightarrow -\frac{11}{10} < \frac{1}{x} < -\frac{9}{10} \Rightarrow -\frac{10}{11} > x > -\frac{10}{9}$ or $-\frac{10}{9} < x < -\frac{10}{11}$.
Step 2: $|x-(-1)| < \delta \Rightarrow -\delta < x+1 < \delta \Rightarrow -\delta-1 < x < \delta-1$.
Then $-\delta-1=-\frac{10}{9} \Rightarrow \delta=\frac{1}{9}$, or $\delta-1=-\frac{10}{11} \Rightarrow \delta=\frac{1}{11}$; thus $\delta=\frac{1}{11}$.

25. Step 1: $|(x^2-5)-11| < 1 \Rightarrow |x^2-16| < 1 \Rightarrow -1 < x^2-16 < 1 \Rightarrow 15 < x^2 < 17 \Rightarrow \sqrt{15} < x < \sqrt{17}$.
Step 2: $|x-4| < \delta \Rightarrow -\delta < x-4 < \delta \Rightarrow -\delta+4 < x < \delta+4$.
Then $-\delta+4=\sqrt{15} \Rightarrow \delta=4-\sqrt{15}\approx 0.1270$, or $\delta+4=\sqrt{17} \Rightarrow \delta=\sqrt{17}-4\approx 0.1231$; thus $\delta=\sqrt{17}-4\approx 0.12$.

26. Step 1: $\left|\frac{120}{x}-5\right| < 1 \Rightarrow -1 < \frac{120}{x}-5 < 1 \Rightarrow 4 < \frac{120}{x} < 6 \Rightarrow \frac{1}{4} > \frac{x}{120} > \frac{1}{6} \Rightarrow 30 > x > 20$ or $20 < x < 30$.
Step 2: $|x-24| < \delta \Rightarrow -\delta < x-24 < \delta \Rightarrow -\delta+24 < x < \delta+24$.
Then $-\delta+24=20 \Rightarrow \delta=4$, or $\delta+24=30 \Rightarrow \delta=6$; thus $\Rightarrow \delta=4$.

27. Step 1: $|mx-2m| < 0.03 \Rightarrow -0.03 < mx-2m < 0.03 \Rightarrow -0.03+2m < mx < 0.03+2m \Rightarrow 2-\frac{0.03}{m} < x < 2+\frac{0.03}{m}$.
Step 2: $|x-2| < \delta \Rightarrow -\delta < x-2 < \delta \Rightarrow -\delta+2 < x < \delta+2$.
Then $-\delta+2=2-\frac{0.03}{m} \Rightarrow \delta=\frac{0.03}{m}$, or $\delta+2=2+\frac{0.03}{m} \Rightarrow \delta=\frac{0.03}{m}$. In either case, $\delta=\frac{0.03}{m}$.

28. Step 1: $|mx-3m| < c \Rightarrow -c < mx-3m < c \Rightarrow -c+3m < mx < c+3m \Rightarrow 3-\frac{c}{m} < x < 3+\frac{c}{m}$
Step 2: $|x-3| < \delta \Rightarrow -\delta < x-3 < \delta \Rightarrow -\delta+3 < x < \delta+3$.
Then $-\delta+3=3-\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$, or $\delta+3=3+\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$. In either case, $\delta=\frac{c}{m}$.

29. Step 1: $\left|(mx+b)-\left(\frac{m}{2}+b\right)\right| < c \Rightarrow -c < mx-\frac{m}{2} < c \Rightarrow -c+\frac{m}{2} < mx < c+\frac{m}{2} \Rightarrow \frac{1}{2}-\frac{c}{m} < x < \frac{1}{2}+\frac{c}{m}$.
Step 2: $\left|x-\frac{1}{2}\right| < \delta \Rightarrow -\delta < x-\frac{1}{2} < \delta \Rightarrow -\delta+\frac{1}{2} < x < \delta+\frac{1}{2}$.
Then $-\delta+\frac{1}{2}=\frac{1}{2}-\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$, or $\delta+\frac{1}{2}=\frac{1}{2}+\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$. In either case, $\delta=\frac{c}{m}$.

30. Step 1: $|(mx+b)-(m+b)| < 0.05 \Rightarrow -0.05 < mx-m < 0.05 \Rightarrow -0.05+m < mx < 0.05+m \Rightarrow 1-\frac{0.05}{m} < x < 1+\frac{0.05}{m}$.
Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow -\delta+1 < x < \delta+1$.
Then $-\delta+1=1-\frac{0.05}{m} \Rightarrow \delta=\frac{0.05}{m}$, or $\delta+1=1+\frac{0.05}{m} \Rightarrow \delta=\frac{0.05}{m}$. In either case, $\delta=\frac{0.05}{m}$.

31. $\lim_{x \to 3} (3 - 2x) = 3 - 2(3) = -3$

Step 1: $|(3 - 2x) - (-3)| < 0.02 \Rightarrow -0.02 < 6 - 2x < 0.02 \Rightarrow -6.02 < -2x < -5.98 \Rightarrow 3.01 > x > 2.99$ or $2.99 < x < 3.01$.

Step 2: $0 < |x - 3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow -\delta + 3 < x < \delta + 3$.

Then $-\delta + 3 = 2.99 \Rightarrow \delta = 0.01$, or $\delta + 3 = 3.01 \Rightarrow \delta = 0.01$; thus $\delta = 0.01$.

32. $\lim_{x \to -1} (-3x - 2) = (-3)(-1) - 2 = 1$

Step 1: $|(-3x - 2) - 1| < 0.03 \Rightarrow -0.03 < -3x - 3 < 0.03 \Rightarrow 0.01 > x + 1 > -0.01 \Rightarrow -1.01 < x < -0.99$.

Step 2: $|x - (-1)| < \delta \Rightarrow -\delta < x + 1 < \delta \Rightarrow -\delta - 1 < x < \delta - 1$.

Then $-\delta - 1 = -1.01 \Rightarrow \delta = 0.01$, or $\delta - 1 = -0.99 \Rightarrow \delta = 0.01$; thus $\delta = 0.01$.

33. $\lim_{x \to 2} \frac{x^2 - 4}{x - 2} = \lim_{x \to 2} \frac{(x+2)(x-2)}{(x-2)} = \lim_{x \to 2} (x + 2) = 2 + 2 = 4, x \neq 2$

Step 1: $\left|\left(\frac{x^2-4}{x-2}\right) - 4\right| < 0.05 \Rightarrow -0.05 < \frac{(x+2)(x-2)}{(x-2)} - 4 < 0.05 \Rightarrow 3.95 < x + 2 < 4.05, x \neq 2$

$\Rightarrow 1.95 < x < 2.05, x \neq 2$.

Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta \Rightarrow -\delta + 2 < x < \delta + 2$.

Then $-\delta + 2 = 1.95 \Rightarrow \delta = 0.05$, or $\delta + 2 = 2.05 \Rightarrow \delta = 0.05$; thus $\delta = 0.05$.

34. $\lim_{x \to -5} \frac{x^2 + 6x + 5}{x + 5} = \lim_{x \to -5} \frac{(x+5)(x+1)}{(x+5)} = \lim_{x \to -5} (x + 1) = -4, x \neq -5$.

Step 1: $\left|\left(\frac{x^2+6x+5}{x+5}\right) - (-4)\right| < 0.05 \Rightarrow -0.05 < \frac{(x+5)(x+1)}{(x+5)} + 4 < 0.05 \Rightarrow -4.05 < x + 1 < -3.95, x \neq -5$

$\Rightarrow -5.05 < x < -4.95, x \neq -5$.

Step 2: $|x - (-5)| < \delta \Rightarrow -\delta < x + 5 < \delta \Rightarrow -\delta - 5 < x < \delta - 5$.

Then $-\delta - 5 = -5.05 \Rightarrow \delta = 0.05$, or $\delta - 5 = -4.95 \Rightarrow \delta = 0.05$; thus $\delta = 0.05$.

35. $\lim_{x \to -3} \sqrt{1 - 5x} = \sqrt{1 - 5(-3)} = \sqrt{16} = 4$

Step 1: $\left|\sqrt{1 - 5x} - 4\right| < 0.5 \Rightarrow -0.5 < \sqrt{1 - 5x} - 4 < 0.5 \Rightarrow 3.5 < \sqrt{1 - 5x} < 4.5 \Rightarrow 12.25 < 1 - 5x < 20.25$

$\Rightarrow 11.25 < -5x < 19.25 \Rightarrow -3.85 < x < -2.25$.

Step 2: $|x - (-3)| < \delta \Rightarrow -\delta < x + 3 < \delta \Rightarrow -\delta - 3 < x < \delta - 3$.

Then $-\delta - 3 = -3.85 \Rightarrow \delta = 0.85$, or $\delta - 3 = -2.25 \Rightarrow 0.75$; thus $\delta = 0.75$.

36. $\lim_{x \to 2} \frac{4}{x} = \frac{4}{2} = 2$

Step 1: $\left|\frac{4}{x} - 2\right| < 0.4 \Rightarrow -0.4 < \frac{4}{x} - 2 < 0.4 \Rightarrow 1.6 < \frac{4}{x} < 2.4 \Rightarrow \frac{10}{16} > \frac{x}{4} > \frac{10}{24} \Rightarrow \frac{10}{4} > x > \frac{10}{6}$ or $\frac{5}{3} < x < \frac{5}{2}$.

Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta \Rightarrow -\delta + 2 < x < \delta + 2$.

Then $-\delta + 2 = \frac{5}{3} \Rightarrow \delta = \frac{1}{3}$, or $\delta + 2 = \frac{5}{2} \Rightarrow \delta = \frac{1}{2}$; thus $\delta = \frac{1}{3}$.

37. Step 1: $|(9 - x) - 5| < \epsilon \Rightarrow -\epsilon < 4 - x < \epsilon \Rightarrow -\epsilon - 4 < -x < \epsilon - 4 \Rightarrow \epsilon + 4 > x > 4 - \epsilon \Rightarrow 4 - \epsilon < x < 4 + \epsilon$.

Step 2: $|x - 4| < \delta \Rightarrow -\delta < x - 4 < \delta \Rightarrow -\delta + 4 < x < \delta + 4$.

Then $-\delta + 4 = -\epsilon + 4 \Rightarrow \delta = \epsilon$, or $\delta + 4 = \epsilon + 4 \Rightarrow \delta = \epsilon$. Thus choose $\delta = \epsilon$.

38. Step 1: $|(3x - 7) - 2| < \epsilon \Rightarrow -\epsilon < 3x - 9 < \epsilon \Rightarrow 9 - \epsilon < 3x < 9 + \epsilon \Rightarrow 3 - \frac{\epsilon}{3} < x < 3 + \frac{\epsilon}{3}$.

Step 2: $|x - 3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow -\delta + 3 < x < \delta + 3$.

Then $-\delta + 3 = 3 - \frac{\epsilon}{3} \Rightarrow \delta = \frac{\epsilon}{3}$, or $\delta + 3 = 3 + \frac{\epsilon}{3} \Rightarrow \delta = \frac{\epsilon}{3}$. Thus choose $\delta = \frac{\epsilon}{3}$.

39. Step 1: $\left|\sqrt{x - 5} - 2\right| < \epsilon \Rightarrow -\epsilon < \sqrt{x - 5} - 2 < \epsilon \Rightarrow 2 - \epsilon < \sqrt{x - 5} < 2 + \epsilon \Rightarrow (2 - \epsilon)^2 < x - 5 < (2 + \epsilon)^2$

$\Rightarrow (2 - \epsilon)^2 + 5 < x < (2 + \epsilon)^2 + 5$.

Step 2: $|x-9| < \delta \Rightarrow -\delta < x-9 < \delta \Rightarrow -\delta+9 < x < \delta+9$.
Then $-\delta+9 = \epsilon^2-4\epsilon+9 \Rightarrow \delta = 4\epsilon-\epsilon^2$, or $\delta+9 = \epsilon^2+4\epsilon+9 \Rightarrow \delta = 4\epsilon+\epsilon^2$. Thus choose the smaller distance, $\delta = 4\epsilon-\epsilon^2$.

40. Step 1: $\left|\sqrt{4-x}-2\right| < \epsilon \Rightarrow -\epsilon < \sqrt{4-x}-2 < \epsilon \Rightarrow 2-\epsilon < \sqrt{4-x} < 2+\epsilon \Rightarrow (2-\epsilon)^2 < 4-x < (2+\epsilon)^2$
$\Rightarrow -(2+\epsilon)^2 < x-4 < -(2-\epsilon)^2 \Rightarrow -(2+\epsilon)^2+4 < x < -(2-\epsilon)^2+4$.
Step 2: $|x-0| < \delta \Rightarrow -\delta < x < \delta$.
Then $-\delta = -(2+\epsilon)^2+4 = -\epsilon^2-4\epsilon \Rightarrow \delta = 4\epsilon+\epsilon^2$, or $\delta = -(2-\epsilon)^2+4 = 4\epsilon-\epsilon^2$. Thus choose the smaller distance, $\delta = 4\epsilon-\epsilon^2$.

41. Step 1: For $x \neq 1$, $|x^2-1| < \epsilon \Rightarrow -\epsilon < x^2-1 < \epsilon \Rightarrow 1-\epsilon < x^2 < 1+\epsilon \Rightarrow \sqrt{1-\epsilon} < |x| < \sqrt{1+\epsilon}$
$\Rightarrow \sqrt{1-\epsilon} < x < \sqrt{1+\epsilon}$ near $x = 1$.
Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow -\delta+1 < x < \delta+1$.
Then $-\delta+1 = \sqrt{1-\epsilon} \Rightarrow \delta = 1-\sqrt{1-\epsilon}$, or $\delta+1 = \sqrt{1+\epsilon} \Rightarrow \delta = \sqrt{1+\epsilon}-1$. Choose $\delta = \min\left\{1-\sqrt{1-\epsilon}, \sqrt{1+\epsilon}-1\right\}$, that is, the smaller of the two distances.

42. Step 1: For $x \neq -2$, $|x^2-4| < \epsilon \Rightarrow -\epsilon < x^2-4 < \epsilon \Rightarrow 4-\epsilon < x^2 < 4+\epsilon \Rightarrow \sqrt{4-\epsilon} < |x| < \sqrt{4+\epsilon}$
$\Rightarrow -\sqrt{4+\epsilon} < x < -\sqrt{4-\epsilon}$ near $x = -2$.
Step 2: $|x-(-2)| < \delta \Rightarrow -\delta < x+2 < \delta \Rightarrow -\delta-2 < x < \delta-2$.
Then $-\delta-2 = -\sqrt{4+\epsilon} \Rightarrow \delta = \sqrt{4+\epsilon}-2$, or $\delta-2 = -\sqrt{4-\epsilon} \Rightarrow \delta = 2-\sqrt{4-\epsilon}$. Choose $\delta = \min\left\{\sqrt{4+\epsilon}-2, 2-\sqrt{4-\epsilon}\right\}$.

43. Step 1: $\left|\frac{1}{x}-1\right| < \epsilon \Rightarrow -\epsilon < \frac{1}{x}-1 < \epsilon \Rightarrow 1-\epsilon < \frac{1}{x} < 1+\epsilon \Rightarrow \frac{1}{1+\epsilon} < x < \frac{1}{1-\epsilon}$.
Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow 1-\delta < x < 1+\delta$.
Then $1-\delta = \frac{1}{1+\epsilon} \Rightarrow \delta = 1-\frac{1}{1+\epsilon} = \frac{\epsilon}{1+\epsilon}$, or $1+\delta = \frac{1}{1-\epsilon} \Rightarrow \delta = \frac{1}{1-\epsilon}-1 = \frac{\epsilon}{1-\epsilon}$.
Choose $\delta = \frac{\epsilon}{1+\epsilon}$, the smaller of the two distances.

44. Step 1: $\left|\frac{1}{x^2}-\frac{1}{3}\right| < \epsilon \Rightarrow -\epsilon < \frac{1}{x^2}-\frac{1}{3} < \epsilon \Rightarrow \frac{1}{3}-\epsilon < \frac{1}{x^2} < \frac{1}{3}+\epsilon \Rightarrow \frac{1-3\epsilon}{3} < \frac{1}{x^2} < \frac{1+3\epsilon}{3} \Rightarrow \frac{3}{1-3\epsilon} > x^2 > \frac{3}{1+3\epsilon}$
$\Rightarrow \sqrt{\frac{3}{1+3\epsilon}} < |x| < \sqrt{\frac{3}{1-3\epsilon}}$, or $\sqrt{\frac{3}{1+3\epsilon}} < x < \sqrt{\frac{3}{1-3\epsilon}}$ for x near $\sqrt{3}$.
Step 2: $\left|x-\sqrt{3}\right| < \delta \Rightarrow -\delta < x-\sqrt{3} < \delta \Rightarrow \sqrt{3}-\delta < x < \sqrt{3}+\delta$.
Then $\sqrt{3}-\delta = \sqrt{\frac{3}{1+3\epsilon}} \Rightarrow \delta = \sqrt{3}-\sqrt{\frac{3}{1+3\epsilon}}$, or $\sqrt{3}+\delta = \sqrt{\frac{3}{1-3\epsilon}} \Rightarrow \delta = \sqrt{\frac{3}{1-3\epsilon}}-\sqrt{3}$.
Choose $\delta = \min\left\{\sqrt{3}-\sqrt{\frac{3}{1+3\epsilon}}, \sqrt{\frac{3}{1-3\epsilon}}-\sqrt{3}\right\}$.

45. Step 1: $\left|\left(\frac{x^2-9}{x+3}\right)-(-6)\right| < \epsilon \Rightarrow -\epsilon < (x-3)+6 < \epsilon, x \neq -3 \Rightarrow -\epsilon < x+3 < \epsilon \Rightarrow -\epsilon-3 < x < \epsilon-3$.
Step 2: $|x-(-3)| < \delta \Rightarrow -\delta < x+3 < \delta \Rightarrow -\delta-3 < x < \delta-3$.
Then $-\delta-3 = -\epsilon-3 \Rightarrow \delta = \epsilon$, or $\delta-3 = \epsilon-3 \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$.

46. Step 1: $\left|\left(\frac{x^2-1}{x-1}\right)-2\right| < \epsilon \Rightarrow -\epsilon < (x+1)-2 < \epsilon, x \neq 1 \Rightarrow 1-\epsilon < x < 1+\epsilon$.
Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow 1-\delta < x < 1+\delta$.
Then $1-\delta = 1-\epsilon \Rightarrow \delta = \epsilon$, or $1+\delta = 1+\epsilon \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$.

47. Step 1: $x < 1$: $|(4 - 2x) - 2| < \epsilon \Rightarrow 0 < 2 - 2x < \epsilon$ since $x < 1$. Thus, $1 - \frac{\epsilon}{2} < x < 0$;
$x \ge 1$: $|(6x - 4) - 2| < \epsilon \Rightarrow 0 \le 6x - 6 < \epsilon$ since $x \ge 1$. Thus, $1 \le x < 1 + \frac{\epsilon}{6}$.
Step 2: $|x - 1| < \delta \Rightarrow -\delta < x - 1 < \delta \Rightarrow 1 - \delta < x < 1 + \delta$.
Then $1 - \delta = 1 - \frac{\epsilon}{2} \Rightarrow \delta = \frac{\epsilon}{2}$, or $1 + \delta = 1 + \frac{\epsilon}{6} \Rightarrow \delta = \frac{\epsilon}{6}$. Choose $\delta = \frac{\epsilon}{6}$.

48. Step 1: $x < 0$: $|2x - 0| < \epsilon \Rightarrow -\epsilon < 2x < 0 \Rightarrow -\frac{\epsilon}{2} < x < 0$;
$x \ge 0$: $\left|\frac{x}{2} - 0\right| < \epsilon \Rightarrow 0 \le x < 2\epsilon$.
Step 2: $|x - 0| < \delta \Rightarrow -\delta < x < \delta$.
Then $-\delta = -\frac{\epsilon}{2} \Rightarrow \delta = \frac{\epsilon}{2}$, or $\delta = 2\epsilon \Rightarrow \delta = 2\epsilon$. Choose $\delta = \frac{\epsilon}{2}$.

49. By the figure, $-x \le x \sin \frac{1}{x} \le x$ for all $x > 0$ and $-x \ge x \sin \frac{1}{x} \ge x$ for $x < 0$. Since $\lim\limits_{x \to 0} (-x) = \lim\limits_{x \to 0} x = 0$, then by the sandwich theorem, in either case, $\lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$.

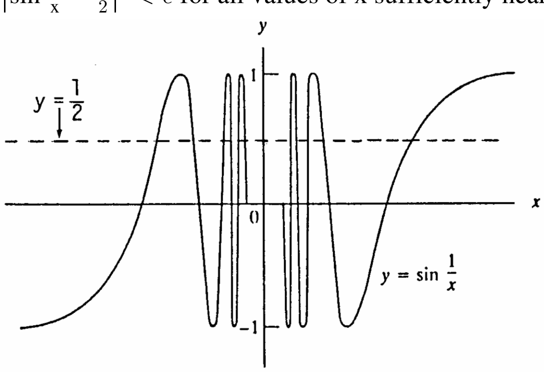
50. By the figure, $-x^2 \le x^2 \sin \frac{1}{x} \le x^2$ for all x except possibly at $x = 0$. Since $\lim\limits_{x \to 0} (-x^2) = \lim\limits_{x \to 0} x^2 = 0$, then by the sandwich theorem, $\lim\limits_{x \to 0} x^2 \sin \frac{1}{x} = 0$.

51. As x approaches the value 0, the values of g(x) approach k. Thus for every number $\epsilon > 0$, there exists a $\delta > 0$ such that $0 < |x - 0| < \delta \Rightarrow |g(x) - k| < \epsilon$.

52. Write $x = h + c$. Then $0 < |x - c| < \delta \Leftrightarrow -\delta < x - c < \delta, x \ne c \Leftrightarrow -\delta < (h + c) - c < \delta, h + c \ne c$
$\Leftrightarrow -\delta < h < \delta, h \ne 0 \Leftrightarrow 0 < |h - 0| < \delta$.
Thus, $\lim\limits_{x \to c} f(x) = L \Leftrightarrow$ for any $\epsilon > 0$, there exists $\delta > 0$ such that $|f(x) - L| < \epsilon$ whenever $0 < |x - c| < \delta$
$\Leftrightarrow |f(h + c) - L| < \epsilon$ whenever $0 < |h - 0| < \delta \Leftrightarrow \lim\limits_{h \to 0} f(h + c) = L$.

53. Let $f(x) = x^2$. The function values do get closer to -1 as x approaches 0, but $\lim\limits_{x \to 0} f(x) = 0$, not -1. The function $f(x) = x^2$ never gets <u>arbitrarily</u> <u>close</u> to -1 for x near 0.

54. Let $f(x) = \sin x$, $L = \frac{1}{2}$, and $c = 0$. There exists a value of x (namely, $x = \frac{\pi}{6}$) for which $\left|\sin x - \frac{1}{2}\right| < \epsilon$ for any given $\epsilon > 0$. However, $\lim\limits_{x \to 0} \sin x = 0$, not $\frac{1}{2}$. The wrong statement does not require x to be arbitrarily close to c. As another example, let $g(x) = \sin \frac{1}{x}$, $L = \frac{1}{2}$, and $c = 0$. We can choose infinitely many values of x near 0 such that $\sin \frac{1}{x} = \frac{1}{2}$ as you can see from the accompanying figure. However, $\lim\limits_{x \to 0} \sin \frac{1}{x}$ fails to exist. The wrong statement does not require <u>all</u> values of x arbitrarily close to $c = 0$ to lie within $\epsilon > 0$ of $L = \frac{1}{2}$. Again you can see from the figure that there are also infinitely many values of x near 0 such that $\sin \frac{1}{x} = 0$. If we choose $\epsilon < \frac{1}{4}$ we cannot satisfy the inequality $\left|\sin \frac{1}{x} - \frac{1}{2}\right| < \epsilon$ for all values of x sufficiently near $c = 0$.



55. $|A-9| \le 0.01 \Rightarrow -0.01 \le \pi\left(\frac{x}{2}\right)^2 - 9 \le 0.01 \Rightarrow 8.99 \le \frac{\pi x^2}{4} \le 9.01 \Rightarrow \frac{4}{\pi}(8.99) \le x^2 \le \frac{4}{\pi}(9.01)$
$\Rightarrow 2\sqrt{\frac{8.99}{\pi}} \le x \le 2\sqrt{\frac{9.01}{\pi}}$ or $3.384 \le x \le 3.387$. To be safe, the left endpoint was rounded up and the right endpoint was rounded down.

56. $V = RI \Rightarrow \frac{V}{R} = I \Rightarrow \left|\frac{V}{R} - 5\right| \le 0.1 \Rightarrow -0.1 \le \frac{120}{R} - 5 \le 0.1 \Rightarrow 4.9 \le \frac{120}{R} \le 5.1 \Rightarrow \frac{10}{49} \ge \frac{R}{120} \ge \frac{10}{51} \Rightarrow$
$\frac{(120)(10)}{51} \le R \le \frac{(120)(10)}{49} \Rightarrow 23.53 \le R \le 24.48$.
To be safe, the left endpoint was rounded up and the right endpoint was rounded down.

57. (a) $-\delta < x-1 < 0 \Rightarrow 1-\delta < x < 1 \Rightarrow f(x) = x$. Then $|f(x)-2| = |x-2| = 2-x > 2-1 = 1$. That is, $|f(x)-2| \ge 1 \ge \frac{1}{2}$ no matter how small δ is taken when $1-\delta < x < 1 \Rightarrow \lim_{x\to 1} f(x) \ne 2$.
(b) $0 < x-1 < \delta \Rightarrow 1 < x < 1+\delta \Rightarrow f(x) = x+1$. Then $|f(x)-1| = |(x+1)-1| = |x| = x > 1$. That is, $|f(x)-1| \ge 1$ no matter how small δ is taken when $1 < x < 1+\delta \Rightarrow \lim_{x\to 1} f(x) \ne 1$.
(c) $-\delta < x-1 < 0 \Rightarrow 1-\delta < x < 1 \Rightarrow f(x) = x$. Then $|f(x)-1.5| = |x-1.5| = 1.5-x > 1.5-1 = 0.5$. Also, $0 < x-1 < \delta \Rightarrow 1 < x < 1+\delta \Rightarrow f(x) = x+1$. Then $|f(x)-1.5| = |(x+1)-1.5| = |x-0.5|$ $= x-0.5 > 1-0.5 = 0.5$. Thus, no matter how small δ is taken, there exists a value of x such that $-\delta < x-1 < \delta$ but $|f(x)-1.5| \ge \frac{1}{2} \Rightarrow \lim_{x\to 1} f(x) \ne 1.5$.

58. (a) For $2 < x < 2+\delta \Rightarrow h(x) = 2 \Rightarrow |h(x)-4| = 2$. Thus for $\epsilon < 2$, $|h(x)-4| \ge \epsilon$ whenever $2 < x < 2+\delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x\to 2} h(x) \ne 4$.
(b) For $2 < x < 2+\delta \Rightarrow h(x) = 2 \Rightarrow |h(x)-3| = 1$. Thus for $\epsilon < 1$, $|h(x)-3| \ge \epsilon$ whenever $2 < x < 2+\delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x\to 2} h(x) \ne 3$.
(c) For $2-\delta < x < 2 \Rightarrow h(x) = x^2$ so $|h(x)-2| = |x^2-2|$. No matter how small $\delta > 0$ is chosen, x^2 is close to 4 when x is near 2 and to the left on the real line $\Rightarrow |x^2-2|$ will be close to 2. Thus if $\epsilon < 1$, $|h(x)-2| \ge \epsilon$ whenever $2-\delta < x < 2$ no mater how small we choose $\delta > 0 \Rightarrow \lim_{x\to 2} h(x) \ne 2$.

59. (a) For $3-\delta < x < 3 \Rightarrow f(x) > 4.8 \Rightarrow |f(x)-4| \ge 0.8$. Thus for $\epsilon < 0.8$, $|f(x)-4| \ge \epsilon$ whenever $3-\delta < x < 3$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x\to 3} f(x) \ne 4$.
(b) For $3 < x < 3+\delta \Rightarrow f(x) < 3 \Rightarrow |f(x)-4.8| \ge 1.8$. Thus for $\epsilon < 1.8$, $|f(x)-4.8| \ge \epsilon$ whenever $3 < x < 3+\delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x\to 3} f(x) \ne 4.8$.
(c) For $3-\delta < x < 3 \Rightarrow f(x) > 4.8 \Rightarrow |f(x)-3| \ge 1.8$. Again, for $\epsilon < 1.8$, $|f(x)-3| \ge \epsilon$ whenever $3-\delta < x < 3$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x\to 3} f(x) \ne 3$.

60. (a) No matter how small we choose $\delta > 0$, for x near -1 satisfying $-1-\delta < x < -1+\delta$, the values of g(x) are near $1 \Rightarrow |g(x)-2|$ is near 1. Then, for $\epsilon = \frac{1}{2}$ we have $|g(x)-2| \ge \frac{1}{2}$ for some x satisfying $-1-\delta < x < -1+\delta$, or $0 < |x+1| < \delta \Rightarrow \lim_{x\to -1} g(x) \ne 2$.
(b) Yes, $\lim_{x\to -1} g(x) = 1$ because from the graph we can find a $\delta > 0$ such that $|g(x)-1| < \epsilon$ if $0 < |x-(-1)| < \delta$.

61-66. Example CAS commands (values of del may vary for a specified eps):
Maple:
```
f := x -> (x^4-81)/(x-3);x0 := 3;
plot( f(x), x=x0-1..x0+1, color=black,                    # (a)
     title="Section 2.3, #61(a)" );
L := limit( f(x), x=x0 );                                  # (b)
epsilon := 0.2;                                            # (c)
```

```
plot( [f(x),L-epsilon,L+epsilon], x=x0-0.01..x0+0.01,
        color=black, linestyle=[1,3,3], title="Section 2.3, #61(c)" );
q := fsolve( abs( f(x)-L ) = epsilon, x=x0-1..x0+1 );                    # (d)
delta := abs(x0-q);
plot( [f(x),L-epsilon,L+epsilon], x=x0-delta..x0+delta, color=black, title="Section 2.3, #61(d)" );
for eps in [0.1, 0.005, 0.001 ] do                                       # (e)
  q := fsolve( abs( f(x)-L ) = eps, x=x0-1..x0+1 );
  delta := abs(x0-q);
  head := sprintf("Section 2.3, #61(e)\n epsilon = %5f, delta = %5f\n", eps, delta );
  print(plot( [f(x),L-eps,L+eps], x=x0-delta..x0+delta,
                  color=black, linestyle=[1,3,3], title=head ));
end do:
```

Mathematica (assigned function and values for x0, eps and del may vary):

```
Clear[f, x]
y1: = L − eps; y2: = L + eps; x0 = 1;
f[x_]: = (3x^2 − (7x + 1)Sqrt[x] + 5)/(x − 1)
Plot[f[x], {x, x0 − 0.2, x0 + 0.2}]
L: = Limit[f[x], x → x0]
eps = 0.1; del = 0.2;
Plot[{f[x], y1, y2},{x, x0 − del, x0 + del}, PlotRange → {L − 2eps, L + 2eps}]
```

   (i) True (j) False (k) True

3. (a) $\lim_{x \to 2^+} f(x) = \frac{2}{2} + 1 = 2$, $\lim_{x \to 2^-} f(x) = 3 - 2 = 1$
   (b) No, $\lim_{x \to 2} f(x)$ does not exist because $\lim_{x \to 2^+} f(x) \neq \lim_{x \to 2^-} f(x)$
   (c) $\lim_{x \to 4^-} f(x) = \frac{4}{2} + 1 = 3$, $\lim_{x \to 4^+} f(x) = \frac{4}{2} + 1 = 3$
   (d) Yes, $\lim_{x \to 4} f(x) = 3$ because $3 = \lim_{x \to 4^-} f(x) = \lim_{x \to 4^+} f(x)$

4. (a) $\lim_{x \to 2^+} f(x) = \frac{2}{2} = 1$, $\lim_{x \to 2^-} f(x) = 3 - 2 = 1$, $f(2) = 2$
   (b) Yes, $\lim_{x \to 2} f(x) = 1$ because $1 = \lim_{x \to 2^+} f(x) = \lim_{x \to 2^-} f(x)$
   (c) $\lim_{x \to -1^-} f(x) = 3 - (-1) = 4$, $\lim_{x \to -1^+} f(x) = 3 - (-1) = 4$
   (d) Yes, $\lim_{x \to -1} f(x) = 4$ because $4 = \lim_{x \to -1^-} f(x) = \lim_{x \to -1^+} f(x)$

5. (a) No, $\lim_{x \to 0^+} f(x)$ does not exist since $\sin\left(\frac{1}{x}\right)$ does not approach any single value as x approaches 0
   (b) $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} 0 = 0$
   (c) $\lim_{x \to 0} f(x)$ does not exist because $\lim_{x \to 0^+} f(x)$ does not exist

6. (a) Yes, $\lim_{x \to 0^+} g(x) = 0$ by the sandwich theorem since $-\sqrt{x} \le g(x) \le \sqrt{x}$ when $x > 0$
   (b) No, $\lim_{x \to 0^-} g(x)$ does not exist since $\sqrt{x}$ is not defined for $x < 0$
   (c) No, $\lim_{x \to 0} g(x)$ does not exist since $\lim_{x \to 0^-} g(x)$ does not exist

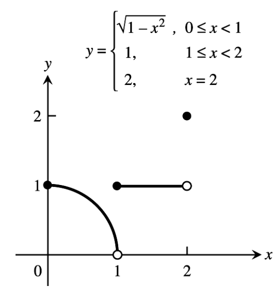
7. (a)

   (b) $\lim_{x \to 1^-} f(x) = 1 = \lim_{x \to 1^+} f(x)$
   (c) Yes, $\lim_{x \to 1} f(x) = 1$ since the right-hand and left-hand limits exist and equal 1

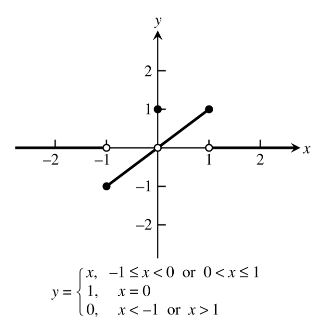
8. (a)

   (b) $\lim_{x \to 1^+} f(x) = 0 = \lim_{x \to 1^-} f(x)$
   (c) Yes, $\lim_{x \to 1} f(x) = 0$ since the right-hand and left-hand limits exist and equal 0

9. (a) domain: $0 \le x \le 2$
   range: $0 < y \le 1$ and $y = 2$
   (b) $\lim_{x \to c} f(x)$ exists for c belonging to $(0, 1) \cup (1, 2)$
   (c) $x = 2$
   (d) $x = 0$



10. (a) domain: $-\infty < x < \infty$
   range: $-1 \le y \le 1$
   (b) $\lim_{x \to c} f(x)$ exists for c belonging to $(-\infty, -1) \cup (-1, 1) \cup (1, \infty)$
   (c) none
   (d) none



11. $\lim_{x \to -0.5^-} \sqrt{\frac{x+2}{x-1}} = \sqrt{\frac{-0.5+2}{-0.5+1}} = \sqrt{\frac{3/2}{1/2}} = \sqrt{3}$

12. $\lim_{x \to 1^+} \sqrt{\frac{x-1}{x+2}} = \sqrt{\frac{1-1}{1+2}} = \sqrt{0} = 0$

13. $\lim_{x \to -2^+} \left(\frac{x}{x+1}\right)\left(\frac{2x+5}{x^2+x}\right) = \left(\frac{-2}{-2+1}\right)\left(\frac{2(-2)+5}{(-2)^2+(-2)}\right) = (2)\left(\frac{1}{2}\right) = 1$

14. $\lim_{x \to 1^-} \left(\frac{1}{x+1}\right)\left(\frac{x+6}{x}\right)\left(\frac{3-x}{7}\right) = \left(\frac{1}{1+1}\right)\left(\frac{1+6}{1}\right)\left(\frac{3-1}{7}\right) = \left(\frac{1}{2}\right)\left(\frac{7}{1}\right)\left(\frac{2}{7}\right) = 1$

15. $\lim\limits_{h \to 0^+} \frac{\sqrt{h^2+4h+5}-\sqrt{5}}{h} = \lim\limits_{h \to 0^+} \left(\frac{\sqrt{h^2+4h+5}-\sqrt{5}}{h}\right)\left(\frac{\sqrt{h^2+4h+5}+\sqrt{5}}{\sqrt{h^2+4h+5}+\sqrt{5}}\right)$
$= \lim\limits_{h \to 0^+} \frac{(h^2+4h+5)-5}{h\left(\sqrt{h^2+4h+5}+\sqrt{5}\right)} = \lim\limits_{h \to 0^+} \frac{h(h+4)}{h\left(\sqrt{h^2+4h+5}+\sqrt{5}\right)} = \frac{0+4}{\sqrt{5}+\sqrt{5}} = \frac{2}{\sqrt{5}}$

16. $\lim\limits_{h \to 0^-} \frac{\sqrt{6}-\sqrt{5h^2+11h+6}}{h} = \lim\limits_{h \to 0^-} \left(\frac{\sqrt{6}-\sqrt{5h^2+11h+6}}{h}\right)\left(\frac{\sqrt{6}+\sqrt{5h^2+11h+6}}{\sqrt{6}+\sqrt{5h^2+11h+6}}\right)$
$= \lim\limits_{h \to 0^-} \frac{6-(5h^2+11h+6)}{h\left(\sqrt{6}+\sqrt{5h^2+11h+6}\right)} = \lim\limits_{h \to 0^-} \frac{-h(5h+11)}{h\left(\sqrt{6}+\sqrt{5h^2+11h+6}\right)} = \frac{-(0+11)}{\sqrt{6}+\sqrt{6}} = -\frac{11}{2\sqrt{6}}$

17. (a) $\lim\limits_{x \to -2^+} (x+3)\frac{|x+2|}{x+2} = \lim\limits_{x \to -2^+} (x+3)\frac{(x+2)}{(x+2)}$ $\quad(|x+2| = (x+2) \text{ for } x > -2)$
$= \lim\limits_{x \to -2^+} (x+3) = ((-2)+3) = 1$

(b) $\lim\limits_{x \to -2^-} (x+3)\frac{|x+2|}{x+2} = \lim\limits_{x \to -2^-} (x+3)\left[\frac{-(x+2)}{(x+2)}\right]$ $\quad(|x+2| = -(x+2) \text{ for } x < -2)$
$= \lim\limits_{x \to -2^-} (x+3)(-1) = -(-2+3) = -1$

18. (a) $\lim\limits_{x \to 1^+} \frac{\sqrt{2x}\,(x-1)}{|x-1|} = \lim\limits_{x \to 1^+} \frac{\sqrt{2x}\,(x-1)}{(x-1)}$ $\quad(|x-1| = x-1 \text{ for } x > 1)$
$= \lim\limits_{x \to 1^+} \sqrt{2x} = \sqrt{2}$

(b) $\lim\limits_{x \to 1^-} \frac{\sqrt{2x}\,(x-1)}{|x-1|} = \lim\limits_{x \to 1^-} \frac{\sqrt{2x}\,(x-1)}{-(x-1)}$ $\quad(|x-1| = -(x-1) \text{ for } x < 1)$
$= \lim\limits_{x \to 1^-} -\sqrt{2x} = -\sqrt{2}$

19. (a) $\lim\limits_{\theta \to 3^+} \frac{\lfloor\theta\rfloor}{\theta} = \frac{3}{3} = 1$ (b) $\lim\limits_{\theta \to 3^-} \frac{\lfloor\theta\rfloor}{\theta} = \frac{2}{3}$

20. (a) $\lim\limits_{t \to 4^+} (t - \lfloor t\rfloor) = 4 - 4 = 0$ (b) $\lim\limits_{t \to 4^-} (t - \lfloor t\rfloor) = 4 - 3 = 1$

21. $\lim\limits_{\theta \to 0} \frac{\sin\sqrt{2}\theta}{\sqrt{2}\theta} = \lim\limits_{x \to 0} \frac{\sin x}{x} = 1$ $\quad$ (where $x = \sqrt{2}\theta$)

22. $\lim\limits_{t \to 0} \frac{\sin kt}{t} = \lim\limits_{t \to 0} \frac{k \sin kt}{kt} = \lim\limits_{\theta \to 0} \frac{k \sin\theta}{\theta} = k \lim\limits_{\theta \to 0} \frac{\sin\theta}{\theta} = k \cdot 1 = k$ $\quad$ (where $\theta = kt$)

23. $\lim\limits_{y \to 0} \frac{\sin 3y}{4y} = \frac{1}{4}\lim\limits_{y \to 0} \frac{3\sin 3y}{3y} = \frac{3}{4}\lim\limits_{y \to 0} \frac{\sin 3y}{3y} = \frac{3}{4}\lim\limits_{\theta \to 0} \frac{\sin\theta}{\theta} = \frac{3}{4}$ $\quad$ (where $\theta = 3y$)

24. $\lim\limits_{h \to 0^-} \frac{h}{\sin 3h} = \lim\limits_{h \to 0^-} \left(\frac{1}{3} \cdot \frac{3h}{\sin 3h}\right) = \frac{1}{3}\lim\limits_{h \to 0^-} \frac{1}{\left(\frac{\sin 3h}{3h}\right)} = \frac{1}{3}\left(\frac{1}{\lim\limits_{\theta \to 0^-} \frac{\sin\theta}{\theta}}\right) = \frac{1}{3} \cdot 1 = \frac{1}{3}$ $\quad$ (where $\theta = 3h$)

25. $\lim\limits_{x \to 0} \frac{\tan 2x}{x} = \lim\limits_{x \to 0} \frac{\left(\frac{\sin 2x}{\cos 2x}\right)}{x} = \lim\limits_{x \to 0} \frac{\sin 2x}{x \cos 2x} = \left(\lim\limits_{x \to 0} \frac{1}{\cos 2x}\right)\left(\lim\limits_{x \to 0} \frac{2\sin 2x}{2x}\right) = 1 \cdot 2 = 2$

26. $\lim\limits_{t \to 0} \frac{2t}{\tan t} = 2\lim\limits_{t \to 0} \frac{t}{\left(\frac{\sin t}{\cos t}\right)} = 2\lim\limits_{t \to 0} \frac{t\cos t}{\sin t} = 2\left(\lim\limits_{t \to 0} \cos t\right)\left(\frac{1}{\lim\limits_{t \to 0} \frac{\sin t}{t}}\right) = 2 \cdot 1 \cdot 1 = 2$

27. $\lim\limits_{x \to 0} \frac{x \csc 2x}{\cos 5x} = \lim\limits_{x \to 0} \left(\frac{x}{\sin 2x} \cdot \frac{1}{\cos 5x}\right) = \left(\frac{1}{2}\lim\limits_{x \to 0} \frac{2x}{\sin 2x}\right)\left(\lim\limits_{x \to 0} \frac{1}{\cos 5x}\right) = \left(\frac{1}{2} \cdot 1\right)(1) = \frac{1}{2}$

28. $\lim\limits_{x \to 0} 6x^2(\cot x)(\csc 2x) = \lim\limits_{x \to 0} \frac{6x^2 \cos x}{\sin x \sin 2x} = \lim\limits_{x \to 0} \left(3\cos x \cdot \frac{x}{\sin x} \cdot \frac{2x}{\sin 2x}\right) = 3 \cdot 1 \cdot 1 = 3$

29. $\lim\limits_{x \to 0} \frac{x + x\cos x}{\sin x \cos x} = \lim\limits_{x \to 0} \left(\frac{x}{\sin x \cos x} + \frac{x \cos x}{\sin x \cos x}\right) = \lim\limits_{x \to 0} \left(\frac{x}{\sin x} \cdot \frac{1}{\cos x}\right) + \lim\limits_{x \to 0} \frac{x}{\sin x}$
$= \lim\limits_{x \to 0} \left(\frac{1}{\frac{\sin x}{x}}\right) \cdot \lim\limits_{x \to 0} \left(\frac{1}{\cos x}\right) + \lim\limits_{x \to 0} \left(\frac{1}{\frac{\sin x}{x}}\right) = (1)(1) + 1 = 2$

30. $\lim\limits_{x \to 0} \frac{x^2 - x + \sin x}{2x} = \lim\limits_{x \to 0} \left(\frac{x}{2} - \frac{1}{2} + \frac{1}{2}\left(\frac{\sin x}{x}\right)\right) = 0 - \frac{1}{2} + \frac{1}{2}(1) = 0$

31. $\lim\limits_{\theta \to 0} \frac{1 - \cos\theta}{\sin 2\theta} = \lim\limits_{\theta \to 0} \frac{(1 - \cos\theta)(1 + \cos\theta)}{(2\sin\theta\cos\theta)(1 + \cos\theta)} = \lim\limits_{\theta \to 0} \frac{1 - \cos^2\theta}{(2\sin\theta\cos\theta)(1 + \cos\theta)} = \lim\limits_{\theta \to 0} \frac{\sin^2\theta}{(2\sin\theta\cos\theta)(1 + \cos\theta)}$
$= \lim\limits_{\theta \to 0} \frac{\sin\theta}{(2\cos\theta)(1 + \cos\theta)} = \frac{0}{(2)(2)} = 0$

32. $\lim\limits_{x \to 0} \frac{x - x\cos x}{\sin^2 3x} = \lim\limits_{x \to 0} \frac{x(1 - \cos x)}{\sin^2 3x} = \lim\limits_{x \to 0} \frac{\frac{x(1 - \cos x)}{9x^2}}{\frac{\sin^2 3x}{9x^2}} = \lim\limits_{x \to 0} \frac{\frac{1 - \cos x}{9x}}{\left(\frac{\sin 3x}{3x}\right)^2} = \frac{\frac{1}{9}\lim\limits_{x\to0}\left(\frac{1 - \cos x}{x}\right)}{\lim\limits_{x\to0}\left(\frac{\sin 3x}{3x}\right)^2} = \frac{\frac{1}{9}(0)}{1^2} = 0$

33. $\lim\limits_{t \to 0} \frac{\sin(1 - \cos t)}{1 - \cos t} = \lim\limits_{\theta \to 0} \frac{\sin\theta}{\theta} = 1$ since $\theta = 1 - \cos t \to 0$ as $t \to 0$

34. $\lim\limits_{h \to 0} \frac{\sin(\sin h)}{\sin h} = \lim\limits_{\theta \to 0} \frac{\sin\theta}{\theta} = 1$ since $\theta = \sin h \to 0$ as $h \to 0$

35. $\lim\limits_{\theta \to 0} \frac{\sin\theta}{\sin 2\theta} = \lim\limits_{\theta \to 0} \left(\frac{\sin\theta}{\sin 2\theta} \cdot \frac{2\theta}{2\theta}\right) = \frac{1}{2}\lim\limits_{\theta \to 0} \left(\frac{\sin\theta}{\theta} \cdot \frac{2\theta}{\sin 2\theta}\right) = \frac{1}{2} \cdot 1 \cdot 1 = \frac{1}{2}$

36. $\lim\limits_{x \to 0} \frac{\sin 5x}{\sin 4x} = \lim\limits_{x \to 0} \left(\frac{\sin 5x}{\sin 4x} \cdot \frac{4x}{5x} \cdot \frac{5}{4}\right) = \frac{5}{4}\lim\limits_{x \to 0} \left(\frac{\sin 5x}{5x} \cdot \frac{4x}{\sin 4x}\right) = \frac{5}{4} \cdot 1 \cdot 1 = \frac{5}{4}$

37. $\lim\limits_{\theta \to 0} \theta\cos\theta = 0 \cdot 1 = 0$

38. $\lim\limits_{\theta \to 0} \sin\theta\cot 2\theta = \lim\limits_{\theta \to 0} \sin\theta\,\frac{\cos 2\theta}{\sin 2\theta} = \lim\limits_{\theta \to 0} \sin\theta\,\frac{\cos 2\theta}{2\sin\theta\cos\theta} = \lim\limits_{\theta \to 0} \frac{\cos 2\theta}{2\cos\theta} = \frac{1}{2}$

39. $\lim\limits_{x \to 0} \frac{\tan 3x}{\sin 8x} = \lim\limits_{x \to 0} \left(\frac{\sin 3x}{\cos 3x} \cdot \frac{1}{\sin 8x}\right) = \lim\limits_{x \to 0} \left(\frac{\sin 3x}{\cos 3x} \cdot \frac{1}{\sin 8x} \cdot \frac{8x}{3x} \cdot \frac{3}{8}\right)$
$= \frac{3}{8}\lim\limits_{x \to 0} \left(\frac{1}{\cos 3x}\right)\left(\frac{\sin 3x}{3x}\right)\left(\frac{8x}{\sin 8x}\right) = \frac{3}{8} \cdot 1 \cdot 1 \cdot 1 = \frac{3}{8}$

40. $\lim\limits_{y \to 0} \frac{\sin 3y \cot 5y}{y \cot 4y} = \lim\limits_{y \to 0} \frac{\sin 3y \sin 4y \cos 5y}{y \cos 4y \sin 5y} = \lim\limits_{y \to 0} \left(\frac{\sin 3y}{y}\right)\left(\frac{\sin 4y}{\cos 4y}\right)\left(\frac{\cos 5y}{\sin 5y}\right)\left(\frac{3 \cdot 4 \cdot 5y}{3 \cdot 4 \cdot 5y}\right)$
$= \lim\limits_{y \to 0} \left(\frac{\sin 3y}{3y}\right)\left(\frac{\sin 4y}{4y}\right)\left(\frac{5y}{\sin 5y}\right)\left(\frac{\cos 5y}{\cos 4y}\right)\left(\frac{3 \cdot 4}{5}\right) = 1 \cdot 1 \cdot 1 \cdot 1 \cdot \frac{12}{5} = \frac{12}{5}$

41. $\lim\limits_{\theta \to 0} \frac{\tan\theta}{\theta^2 \cot 3\theta} = \lim\limits_{\theta \to 0} \frac{\frac{\sin\theta}{\cos\theta}}{\theta^2 \frac{\cos 3\theta}{\sin 3\theta}} = \lim\limits_{\theta \to 0} \frac{\sin\theta \sin 3\theta}{\theta^2 \cos\theta \cos 3\theta} = \lim\limits_{\theta \to 0} \left(\frac{\sin\theta}{\theta}\right)\left(\frac{\sin 3\theta}{3\theta}\right)\left(\frac{3}{\cos\theta\cos 3\theta}\right) = (1)(1)\left(\frac{3}{1 \cdot 1}\right) = 3$

42. $\lim\limits_{\theta \to 0} \frac{\theta\cot 4\theta}{\sin^2\theta \cot^2 2\theta} = \lim\limits_{\theta \to 0} \frac{\theta\,\frac{\cos 4\theta}{\sin 4\theta}}{\sin^2\theta\,\frac{\cos^2 2\theta}{\sin^2 2\theta}} = \lim\limits_{\theta \to 0} \frac{\theta\cos 4\theta \sin^2 2\theta}{\sin^2\theta \cos^2 2\theta \sin 4\theta} = \lim\limits_{\theta \to 0} \frac{\theta\cos 4\theta\,(2\sin\theta\cos\theta)^2}{\sin^2\theta\cos^2 2\theta \sin 4\theta} = \lim\limits_{\theta \to 0} \frac{\theta\cos 4\theta\,(4\sin^2\theta\cos^2\theta)}{\sin^2\theta\cos^2 2\theta\sin 4\theta}$
$= \lim\limits_{\theta \to 0} \frac{4\theta\cos 4\theta\cos^2\theta}{\cos^2 2\theta \sin 4\theta} = \lim\limits_{\theta \to 0} \left(\frac{4\theta}{\sin 4\theta}\right)\left(\frac{\cos 4\theta\cos^2\theta}{\cos^2 2\theta}\right) = \lim\limits_{\theta \to 0} \left(\frac{1}{\frac{\sin 4\theta}{4\theta}}\right)\left(\frac{\cos 4\theta\cos^2\theta}{\cos^2 2\theta}\right) = \left(\frac{1}{1}\right)\left(\frac{1 \cdot 1^2}{1^2}\right) = 1$

43. Yes. If $\lim\limits_{x \to a^+} f(x) = L = \lim\limits_{x \to a^-} f(x)$, then $\lim\limits_{x \to a} f(x) = L$. If $\lim\limits_{x \to a^+} f(x) \neq \lim\limits_{x \to a^-} f(x)$, then $\lim\limits_{x \to a} f(x)$ does not exist.

44. Since $\lim\limits_{x \to c} f(x) = L$ if and only if $\lim\limits_{x \to c^+} f(x) = L$ and $\lim\limits_{x \to c^-} f(x) = L$, then $\lim\limits_{x \to c} f(x)$ can be found by calculating $\lim\limits_{x \to c^+} f(x)$.

45. If f is an odd function of x, then $f(-x) = -f(x)$. Given $\lim_{x \to 0^+} f(x) = 3$, then $\lim_{x \to 0^-} f(x) = -3$.

46. If f is an even function of x, then $f(-x) = f(x)$. Given $\lim_{x \to 2^-} f(x) = 7$ then $\lim_{x \to -2^+} f(x) = 7$. However, nothing can be said about $\lim_{x \to -2^-} f(x)$ because we don't know $\lim_{x \to 2^+} f(x)$.

47. $I = (5, 5+\delta) \Rightarrow 5 < x < 5+\delta$. Also, $\sqrt{x-5} < \epsilon \Rightarrow x - 5 < \epsilon^2 \Rightarrow x < 5 + \epsilon^2$. Choose $\delta = \epsilon^2$ $\Rightarrow \lim_{x \to 5^+} \sqrt{x-5} = 0$.

48. $I = (4-\delta, 4) \Rightarrow 4 - \delta < x < 4$. Also, $\sqrt{4-x} < \epsilon \Rightarrow 4 - x < \epsilon^2 \Rightarrow x > 4 - \epsilon^2$. Choose $\delta = \epsilon^2$ $\Rightarrow \lim_{x \to 4^-} \sqrt{4-x} = 0$.

49. As $x \to 0^-$ the number x is always negative. Thus, $\left|\frac{x}{|x|} - (-1)\right| < \epsilon \Rightarrow \left|\frac{x}{-x} + 1\right| < \epsilon \Rightarrow 0 < \epsilon$ which is always true independent of the value of x. Hence we can choose any $\delta > 0$ with $-\delta < x < 0 \Rightarrow \lim_{x \to 0^-} \frac{x}{|x|} = -1$.

50. Since $x \to 2^+$ we have $x > 2$ and $|x-2| = x - 2$. Then, $\left|\frac{x-2}{|x-2|} - 1\right| = \left|\frac{x-2}{x-2} - 1\right| < \epsilon \Rightarrow 0 < \epsilon$ which is always true so long as $x > 2$. Hence we can choose any $\delta > 0$, and thus $2 < x < 2 + \delta$ $\Rightarrow \left|\frac{x-2}{|x-2|} - 1\right| < \epsilon$. Thus, $\lim_{x \to -2^+} \frac{x-2}{|x-2|} = 1$.

51. (a) $\lim_{x \to 400^+} \lfloor x \rfloor = 400$. Just observe that if $400 < x < 401$, then $\lfloor x \rfloor = 400$. Thus if we choose $\delta = 1$, we have for any number $\epsilon > 0$ that $400 < x < 400 + \delta \Rightarrow |\lfloor x \rfloor - 400| = |400 - 400| = 0 < \epsilon$.
    (b) $\lim_{x \to 400^-} \lfloor x \rfloor = 399$. Just observe that if $399 < x < 400$ then $\lfloor x \rfloor = 399$. Thus if we choose $\delta = 1$, we have for any number $\epsilon > 0$ that $400 - \delta < x < 400 \Rightarrow |\lfloor x \rfloor - 399| = |399 - 399| = 0 < \epsilon$.
    (c) Since $\lim_{x \to 400^+} \lfloor x \rfloor \neq \lim_{x \to 400^-} \lfloor x \rfloor$ we conclude that $\lim_{x \to 400} \lfloor x \rfloor$ does not exist.

52. (a) $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \sqrt{x} = \sqrt{0} = 0$; $\left|\sqrt{x} - 0\right| < \epsilon \Rightarrow -\epsilon < \sqrt{x} < \epsilon \Rightarrow 0 < x < \epsilon^2$ for x positive. Choose $\delta = \epsilon^2$ $\Rightarrow \lim_{x \to 0^+} f(x) = 0$.
    (b) $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} x^2 \sin\left(\frac{1}{x}\right) = 0$ by the sandwich theorem since $-x^2 \le x^2 \sin\left(\frac{1}{x}\right) \le x^2$ for all $x \neq 0$. Since $|x^2 - 0| = |-x^2 - 0| = x^2 < \epsilon$ whenever $|x| < \sqrt{\epsilon}$, we choose $\delta = \sqrt{\epsilon}$ and obtain $\left|x^2 \sin\left(\frac{1}{x}\right) - 0\right| < \epsilon$ if $-\delta < x < 0$.
    (c) The function f has limit 0 at $x_0 = 0$ since both the right-hand and left-hand limits exist and equal 0.

2.5 CONTINUITY

1. No, discontinuous at $x = 2$, not defined at $x = 2$

2. No, discontinuous at $x = 3$, $1 = \lim_{x \to 3^-} g(x) \neq g(3) = 1.5$

3. Continuous on $[-1, 3]$

4. No, discontinuous at $x = 1$, $1.5 = \lim_{x \to 1^-} k(x) \neq \lim_{x \to 1^+} k(x) = 0$

5. (a) Yes (b) Yes, $\lim_{x \to -1^+} f(x) = 0$
   (c) Yes (d) Yes

6. (a) Yes, $f(1) = 1$ (b) Yes, $\lim_{x \to 1} f(x) = 2$
   (c) No (d) No

7. (a) No (b) No

8. $[-1, 0) \cup (0, 1) \cup (1, 2) \cup (2, 3)$

9. $f(2) = 0$, since $\lim_{x \to 2^-} f(x) = -2(2) + 4 = 0 = \lim_{x \to 2^+} f(x)$

10. $f(1)$ should be changed to $2 = \lim_{x \to 1} f(x)$

11. Nonremovable discontinuity at $x = 1$ because $\lim_{x \to 1} f(x)$ fails to exist ($\lim_{x \to 1^-} f(x) = 1$ and $\lim_{x \to 1^+} f(x) = 0$).
    Removable discontinuity at $x = 0$ by assigning the number $\lim_{x \to 0} f(x) = 0$ to be the value of $f(0)$ rather than $f(0) = 1$.

12. Nonremovable discontinuity at $x = 1$ because $\lim_{x \to 1} f(x)$ fails to exist ($\lim_{x \to 1^-} f(x) = 2$ and $\lim_{x \to 1^+} f(x) = 1$).
    Removable discontinuity at $x = 2$ by assigning the number $\lim_{x \to 2} f(x) = 1$ to be the value of $f(2)$ rather than $f(2) = 2$.

13. Discontinuous only when $x - 2 = 0 \Rightarrow x = 2$

14. Discontinuous only when $(x + 2)^2 = 0 \Rightarrow x = -2$

15. Discontinuous only when $x^2 - 4x + 3 = 0 \Rightarrow (x - 3)(x - 1) = 0 \Rightarrow x = 3$ or $x = 1$

16. Discontinuous only when $x^2 - 3x - 10 = 0 \Rightarrow (x - 5)(x + 2) = 0 \Rightarrow x = 5$ or $x = -2$

17. Continuous everywhere. ($|x - 1| + \sin x$ defined for all x; limits exist and are equal to function values.)

18. Continuous everywhere. ($|x| + 1 \neq 0$ for all x; limits exist and are equal to function values.)

19. Discontinuous only at $x = 0$

20. Discontinuous at odd integer multiples of $\frac{\pi}{2}$, i.e., $x = (2n - 1)\frac{\pi}{2}$, n an integer, but continuous at all other x.

21. Discontinuous when 2x is an integer multiple of π, i.e., $2x = n\pi$, n an integer $\Rightarrow x = \frac{n\pi}{2}$, n an integer, but continuous at all other x.

22. Discontinuous when $\frac{\pi x}{2}$ is an odd integer multiple of $\frac{\pi}{2}$, i.e., $\frac{\pi x}{2} = (2n - 1)\frac{\pi}{2}$, n an integer $\Rightarrow x = 2n - 1$, n an integer (i.e., x is an odd integer). Continuous everywhere else.

23. Discontinuous at odd integer multiples of $\frac{\pi}{2}$, i.e., $x = (2n - 1)\frac{\pi}{2}$, n an integer, but continuous at all other x.

24. Continuous everywhere since $x^4 + 1 \geq 1$ and $-1 \leq \sin x \leq 1 \Rightarrow 0 \leq \sin^2 x \leq 1 \Rightarrow 1 + \sin^2 x \geq 1$; limits exist and are equal to the function values.

25. Discontinuous when $2x + 3 < 0$ or $x < -\frac{3}{2} \Rightarrow$ continuous on the interval $\left[-\frac{3}{2}, \infty\right)$.

26. Discontinuous when $3x - 1 < 0$ or $x < \frac{1}{3} \Rightarrow$ continuous on the interval $\left[\frac{1}{3}, \infty\right)$.

27. Continuous everywhere: $(2x - 1)^{1/3}$ is defined for all x; limits exist and are equal to function values.

28. Continuous everywhere: $(2 - x)^{1/5}$ is defined for all x; limits exist and are equal to function values.

29. Continuous everywhere since $\lim\limits_{x \to 3} \frac{x^2 - x - 6}{x - 3} = \lim\limits_{x \to 3} \frac{(x-3)(x+2)}{x-3} = \lim\limits_{x \to 3} (x + 2) = 5 = g(3)$

30. Discontinuous at $x = -2$ since $\lim\limits_{x \to -2} f(x)$ does not exist while $f(-2) = 4$.

31. $\lim\limits_{x \to \pi} \sin(x - \sin x) = \sin(\pi - \sin \pi) = \sin(\pi - 0) = \sin \pi = 0$, and the function is continuous at $x = \pi$.

32. $\lim\limits_{t \to 0} \sin\left(\frac{\pi}{2} \cos(\tan t)\right) = \sin\left(\frac{\pi}{2} \cos(\tan(0))\right) = \sin\left(\frac{\pi}{2} \cos(0)\right) = \sin\left(\frac{\pi}{2}\right) = 1$, and the function is continuous at $t = 0$.

33. $\lim\limits_{y \to 1} \sec(y \sec^2 y - \tan^2 y - 1) = \lim\limits_{y \to 1} \sec(y \sec^2 y - \sec^2 y) = \lim\limits_{y \to 1} \sec((y - 1)\sec^2 y) = \sec((1 - 1)\sec^2 1)$
$= \sec 0 = 1$, and the function is continuous at $y = 1$.

34. $\lim\limits_{x \to 0} \tan\left[\frac{\pi}{4} \cos\left(\sin x^{1/3}\right)\right] = \tan\left[\frac{\pi}{4} \cos(\sin(0))\right] = \tan\left(\frac{\pi}{4} \cos(0)\right) = \tan\left(\frac{\pi}{4}\right) = 1$, and the function is continuous at $x = 0$.

35. $\lim\limits_{t \to 0} \cos\left[\frac{\pi}{\sqrt{19 - 3 \sec 2t}}\right] = \cos\left[\frac{\pi}{\sqrt{19 - 3 \sec 0}}\right] = \cos \frac{\pi}{\sqrt{16}} = \cos \frac{\pi}{4} = \frac{\sqrt{2}}{2}$, and the function is continuous at $t = 0$.

36. $\lim\limits_{x \to \frac{\pi}{6}} \sqrt{\csc^2 x + 5\sqrt{3} \tan x} = \sqrt{\csc^2\left(\frac{\pi}{6}\right) + 5\sqrt{3} \tan\left(\frac{\pi}{6}\right)} = \sqrt{4 + 5\sqrt{3}\left(\frac{1}{\sqrt{3}}\right)} = \sqrt{9} = 3$, and the function is continuous at $x = \frac{\pi}{6}$.

37. $\lim\limits_{x \to 0^+} \sin\left(\frac{\pi}{2} e^{\sqrt{x}}\right) = \sin\left(\frac{\pi}{2} e^0\right) = \sin\left(\frac{\pi}{2}\right) = 1$, and the function is continuous at $x = 0$.

38. $\lim\limits_{x \to 1} \cos^{-1}\left(\ln \sqrt{x}\right) = \cos^{-1}\left(\ln \sqrt{1}\right) = \cos^{-1}(0) = \frac{\pi}{2}$, and the function is continuous at $x = 1$.

39. $g(x) = \frac{x^2 - 9}{x - 3} = \frac{(x+3)(x-3)}{(x-3)} = x + 3, x \neq 3 \Rightarrow g(3) = \lim\limits_{x \to 3} (x + 3) = 6$

40. $h(t) = \frac{t^2 + 3t - 10}{t - 2} = \frac{(t+5)(t-2)}{t-2} = t + 5, t \neq 2 \Rightarrow h(2) = \lim\limits_{t \to 2} (t + 5) = 7$

41. $f(s) = \frac{s^3 - 1}{s^2 - 1} = \frac{(s^2+s+1)(s-1)}{(s+1)(s-1)} = \frac{s^2+s+1}{s+1}, s \neq 1 \Rightarrow f(1) = \lim\limits_{s \to 1} \left(\frac{s^2+s+1}{s+1}\right) = \frac{3}{2}$

42. $g(x) = \frac{x^2 - 16}{x^2 - 3x - 4} = \frac{(x+4)(x-4)}{(x-4)(x+1)} = \frac{x+4}{x+1}, x \neq 4 \Rightarrow g(4) = \lim\limits_{x \to 4} \left(\frac{x+4}{x+1}\right) = \frac{8}{5}$

43. As defined, $\lim\limits_{x \to 3^-} f(x) = (3)^2 - 1 = 8$ and $\lim\limits_{x \to 3^+} (2a)(3) = 6a$. For f(x) to be continuous we must have $6a = 8 \Rightarrow a = \frac{4}{3}$.

44. As defined, $\lim_{x \to -2^-} g(x) = -2$ and $\lim_{x \to -2^+} g(x) = b(-2)^2 = 4b$. For g(x) to be continuous we must have $4b = -2 \Rightarrow b = -\frac{1}{2}$.

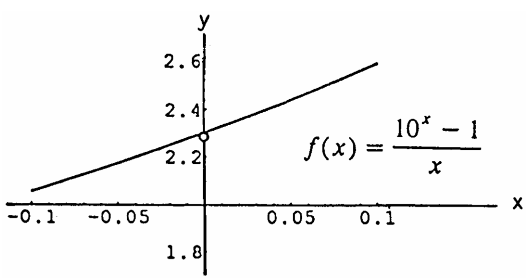
45. As defined, $\lim_{x \to 2^-} f(x) = 12$ and $\lim_{x \to 2^+} f(x) = a^2(2) - 2a = 2a^2 - 2a$. For f(x) to be continuous we must have $12 = 2a^2 - 2a \Rightarrow a = 3$ or $a = -2$.

46. As defined, $\lim_{x \to 0^-} g(x) = \frac{0-b}{b+1} = \frac{-b}{b+1}$ and $\lim_{x \to 0^+} g(x) = (0)^2 + b = b$. For g(x) to be continuous we must have $\frac{-b}{b+1} = b \Rightarrow b = 0$ or $b = -2$.

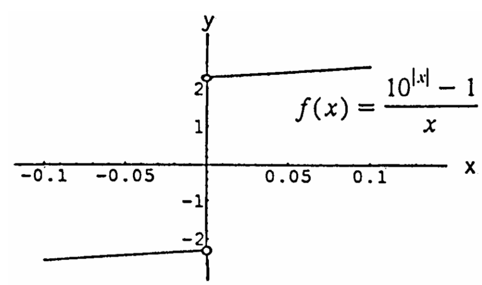
47. As defined, $\lim_{x \to -1^-} f(x) = -2$ and $\lim_{x \to -1^+} f(x) = a(-1) + b = -a + b$, and $\lim_{x \to 1^-} f(x) = a(1) + b = a + b$ and $\lim_{x \to 1^+} f(x) = 3$. For f(x) to be continuous we must have $-2 = -a + b$ and $a + b = 3 \Rightarrow a = \frac{5}{2}$ and $b = \frac{1}{2}$.

48. As defined, $\lim_{x \to 0^-} g(x) = a(0) + 2b = 2b$ and $\lim_{x \to 0^+} g(x) = (0)^2 + 3a - b = 3a - b$, and $\lim_{x \to 2^-} g(x) = (2)^2 + 3a - b = 4 + 3a - b$ and $\lim_{x \to 0^+} g(x) = 3(2) - 5 = 1$. For g(x) to be continuous we must have $2b = 3a - b$ and $4 + 3a - b = 1 \Rightarrow a = -\frac{3}{2}$ and $b = -\frac{3}{2}$.

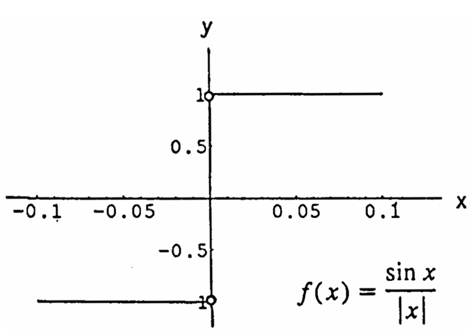
49. The function can be extended: $f(0) \approx 2.3$.



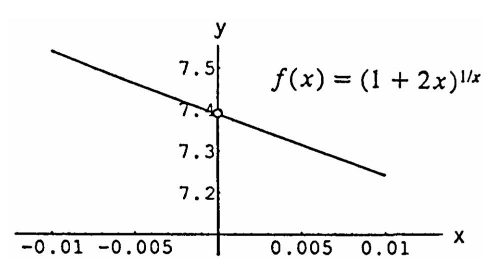
50. The function cannot be extended to be continuous at $x = 0$. If $f(0) \approx 2.3$, it will be continuous from the right. Or if $f(0) \approx -2.3$, it will be continuous from the left.



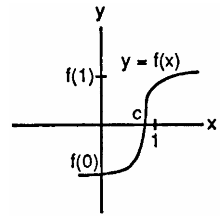
51. The function cannot be extended to be continuous at $x = 0$. If $f(0) = 1$, it will be continuous from the right. Or if $f(0) = -1$, it will be continuous from the left.



52. The function can be extended: $f(0) \approx 7.39$.



53. $f(x)$ is continuous on $[0, 1]$ and $f(0) < 0$, $f(1) > 0$ $\Rightarrow$ by the Intermediate Value Theorem $f(x)$ takes on every value between $f(0)$ and $f(1)$ $\Rightarrow$ the equation $f(x) = 0$ has at least one solution between $x = 0$ and $x = 1$.



54. $\cos x = x \Rightarrow (\cos x) - x = 0$. If $x = -\frac{\pi}{2}$, $\cos\left(-\frac{\pi}{2}\right) - \left(-\frac{\pi}{2}\right) > 0$. If $x = \frac{\pi}{2}$, $\cos\left(\frac{\pi}{2}\right) - \frac{\pi}{2} < 0$. Thus $\cos x - x = 0$ for some x between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$ according to the Intermediate Value Theorem, since the function $\cos x - x$ is continuous.

55. Let $f(x) = x^3 - 15x + 1$, which is continuous on $[-4, 4]$. Then $f(-4) = -3$, $f(-1) = 15$, $f(1) = -13$, and $f(4) = 5$. By the Intermediate Value Theorem, $f(x) = 0$ for some x in each of the intervals $-4 < x < -1$, $-1 < x < 1$, and $1 < x < 4$. That is, $x^3 - 15x + 1 = 0$ has three solutions in $[-4, 4]$. Since a polynomial of degree 3 can have at most 3 solutions, these are the only solutions.

56. Without loss of generality, assume that $a < b$. Then $F(x) = (x - a)^2 (x - b)^2 + x$ is continuous for all values of x, so it is continuous on the interval $[a, b]$. Moreover $F(a) = a$ and $F(b) = b$. By the Intermediate Value Theorem, since $a < \frac{a+b}{2} < b$, there is a number c between a and b such that $F(x) = \frac{a+b}{2}$.

57. Answers may vary. Note that f is continuous for every value of x.
   (a) $f(0) = 10$, $f(1) = 1^3 - 8(1) + 10 = 3$. Since $3 < \pi < 10$, by the Intermediate Value Theorem, there exists a c so that $0 < c < 1$ and $f(c) = \pi$.
   (b) $f(0) = 10$, $f(-4) = (-4)^3 - 8(-4) + 10 = -22$. Since $-22 < -\sqrt{3} < 10$, by the Intermediate Value Theorem, there exists a c so that $-4 < c < 0$ and $f(c) = -\sqrt{3}$.
   (c) $f(0) = 10$, $f(1000) = (1000)^3 - 8(1000) + 10 = 999{,}992{,}010$. Since $10 < 5{,}000{,}000 < 999{,}992{,}010$, by the Intermediate Value Theorem, there exists a c so that $0 < c < 1000$ and $f(c) = 5{,}000{,}000$.

58. All five statements ask for the same information because of the intermediate value property of continuous functions.
   (a) A root of $f(x) = x^3 - 3x - 1$ is a point c where $f(c) = 0$.
   (b) The points where $y = x^3$ crosses $y = 3x + 1$ have the same y-coordinate, or $y = x^3 = 3x + 1$ $\Rightarrow f(x) = x^3 - 3x - 1 = 0$.
   (c) $x^3 - 3x = 1 \Rightarrow x^3 - 3x - 1 = 0$. The solutions to the equation are the roots of $f(x) = x^3 - 3x - 1$.
   (d) The points where $y = x^3 - 3x$ crosses $y = 1$ have common y-coordinates, or $y = x^3 - 3x = 1$ $\Rightarrow f(x) = x^3 - 3x - 1 = 0$.
   (e) The solutions of $x^3 - 3x - 1 = 0$ are those points where $f(x) = x^3 - 3x - 1$ has value 0.

59. Answers may vary. For example, $f(x) = \frac{\sin(x-2)}{x-2}$ is discontinuous at $x = 2$ because it is not defined there. However, the discontinuity can be removed because f has a limit (namely 1) as $x \to 2$.

60. Answers may vary. For example, $g(x) = \frac{1}{x+1}$ has a discontinuity at $x = -1$ because $\lim_{x \to -1} g(x)$ does not exist. $\left(\lim_{x \to -1^-} g(x) = -\infty \text{ and } \lim_{x \to -1^+} g(x) = +\infty.\right)$

61. (a) Suppose c is rational $\Rightarrow f(c) = 1$. Choose $\epsilon = \frac{1}{2}$. For any $\delta > 0$ there is an irrational number x (actually infinitely many) in the interval $(c - \delta, c + \delta) \Rightarrow f(x) = 0$. Then $0 < |x - c| < \delta$ but $|f(x) - f(c)| = 1 > \frac{1}{2} = \epsilon$, so $\lim_{x \to c} f(x)$ fails to exist $\Rightarrow$ f is discontinuous at c rational.

On the other hand, c irrational $\Rightarrow$ f(c) = 0 and there is a rational number x in $(c-\delta, c+\delta) \Rightarrow f(x) = 1$. Again $\lim_{x \to c} f(x)$ fails to exist $\Rightarrow$ f is discontinuous at c irrational. That is, f is discontinuous at every point.

(b) f is neither right-continuous nor left-continuous at any point c because in every interval $(c-\delta, c)$ or $(c, c+\delta)$ there exist both rational and irrational real numbers. Thus neither limits $\lim_{x \to c^-} f(x)$ and $\lim_{x \to c^+} f(x)$ exist by the same arguments used in part (a).

62. Yes. Both $f(x) = x$ and $g(x) = x - \frac{1}{2}$ are continuous on $[0, 1]$. However $\frac{f(x)}{g(x)}$ is undefined at $x = \frac{1}{2}$ since $g\left(\frac{1}{2}\right) = 0 \Rightarrow \frac{f(x)}{g(x)}$ is discontinuous at $x = \frac{1}{2}$.

63. No. For instance, if $f(x) = 0$, $g(x) = \lceil x \rceil$, then $h(x) = 0\left(\lceil x \rceil\right) = 0$ is continuous at $x = 0$ and g(x) is not.

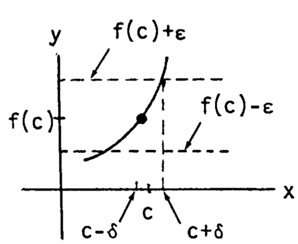
64. Let $f(x) = \frac{1}{x-1}$ and $g(x) = x + 1$. Both functions are continuous at $x = 0$. The composition $f \circ g = f(g(x)) = \frac{1}{(x+1)-1} = \frac{1}{x}$ is discontinuous at $x = 0$, since it is not defined there. Theorem 9 requires that f(x) be continuous at g(0), which is not the case here since $g(0) = 1$ and f is undefined at 1.

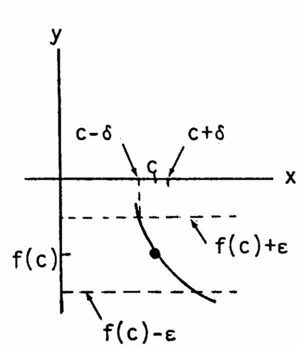
65. Yes, because of the Intermediate Value Theorem. If f(a) and f(b) did have different signs then f would have to equal zero at some point between a and b since f is continuous on $[a, b]$.

66. Let f(x) be the new position of point x and let $d(x) = f(x) - x$. The displacement function d is negative if x is the left-hand point of the rubber band and positive if x is the right-hand point of the rubber band. By the Intermediate Value Theorem, $d(x) = 0$ for some point in between. That is, $f(x) = x$ for some point x, which is then in its original position.

67. If $f(0) = 0$ or $f(1) = 1$, we are done (i.e., $c = 0$ or $c = 1$ in those cases). Then let $f(0) = a > 0$ and $f(1) = b < 1$ because $0 \le f(x) \le 1$. Define $g(x) = f(x) - x \Rightarrow$ g is continuous on $[0, 1]$. Moreover, $g(0) = f(0) - 0 = a > 0$ and $g(1) = f(1) - 1 = b - 1 < 0 \Rightarrow$ by the Intermediate Value Theorem there is a number c in $(0, 1)$ such that $g(c) = 0 \Rightarrow f(c) - c = 0$ or $f(c) = c$.

68. Let $\epsilon = \frac{|f(c)|}{2} > 0$. Since f is continuous at $x = c$ there is a $\delta > 0$ such that $|x - c| < \delta \Rightarrow |f(x) - f(c)| < \epsilon$ $\Rightarrow f(c) - \epsilon < f(x) < f(c) + \epsilon$.
If $f(c) > 0$, then $\epsilon = \frac{1}{2} f(c) \Rightarrow \frac{1}{2} f(c) < f(x) < \frac{3}{2} f(c) \Rightarrow f(x) > 0$ on the interval $(c - \delta, c + \delta)$.
If $f(c) < 0$, then $\epsilon = -\frac{1}{2} f(c) \Rightarrow \frac{3}{2} f(c) < f(x) < \frac{1}{2} f(c) \Rightarrow f(x) < 0$ on the interval $(c - \delta, c + \delta)$.





69. By Exercise 52 in Section 2.3, we have $\lim_{x \to c} f(x) = L \Leftrightarrow \lim_{h \to 0} f(c + h) = L$.
Thus, f(x) is continuous at $x = c \Leftrightarrow \lim_{x \to c} f(x) = f(c) \Leftrightarrow \lim_{h \to 0} f(c + h) = f(c)$.

70. By Exercise 69, it suffices to show that $\lim_{h \to 0} \sin(c+h) = \sin c$ and $\lim_{h \to 0} \cos(c+h) = \cos c$.

Now $\lim_{h \to 0} \sin(c+h) = \lim_{h \to 0} \left[(\sin c)(\cos h) + (\cos c)(\sin h)\right] = (\sin c)\left(\lim_{h \to 0} \cos h\right) + (\cos c)\left(\lim_{h \to 0} \sin h\right)$

By Example 11 Section 2.2, $\lim_{h \to 0} \cos h = 1$ and $\lim_{h \to 0} \sin h = 0$. So $\lim_{h \to 0} \sin(c+h) = \sin c$ and thus $f(x) = \sin x$ is continuous at $x = c$. Similarly,

$\lim_{h \to 0} \cos(c+h) = \lim_{h \to 0} \left[(\cos c)(\cos h) - (\sin c)(\sin h)\right] = (\cos c)\left(\lim_{h \to 0} \cos h\right) - (\sin c)\left(\lim_{h \to 0} \sin h\right) = \cos c.$

Thus, $g(x) = \cos x$ is continuous at $x = c$.

71. $x \approx 1.8794, -1.5321, -0.3473$

72. $x \approx 1.4516, -0.8547, 0.4030$

73. $x \approx 1.7549$

74. $x \approx 1.5596$

75. $x \approx 3.5156$

76. $x \approx -3.9058, 3.8392, 0.0667$

77. $x \approx 0.7391$

78. $x \approx -1.8955, 0, 1.8955$

2.6 LIMITS INVOLVING INFINITY; ASMYPTOTES OF GRAPHS

1. (a) $\lim_{x \to 2} f(x) = 0$
(b) $\lim_{x \to -3^+} f(x) = -2$
(c) $\lim_{x \to -3^-} f(x) = 2$
(d) $\lim_{x \to 3} f(x) =$ does not exist
(e) $\lim_{x \to 0^+} f(x) = -1$
(f) $\lim_{x \to 0^-} f(x) = +\infty$
(g) $\lim_{x \to 0} f(x) =$ does not exist
(h) $\lim_{x \to \infty} f(x) = 1$
(i) $\lim_{x \to -\infty} f(x) = 0$

2. (a) $\lim_{x \to 4} f(x) = 2$
(b) $\lim_{x \to 2^+} f(x) = -3$
(c) $\lim_{x \to 2^-} f(x) = 1$
(d) $\lim_{x \to 2} f(x) =$ does not exist
(e) $\lim_{x \to -3^+} f(x) = +\infty$
(f) $\lim_{x \to -3^-} f(x) = +\infty$
(g) $\lim_{x \to -3} f(x) = +\infty$
(h) $\lim_{x \to 0^+} f(x) = +\infty$
(i) $\lim_{x \to 0^-} f(x) = -\infty$
(j) $\lim_{x \to 0} f(x) =$ does not exist
(k) $\lim_{x \to \infty} f(x) = 0$
(l) $\lim_{x \to -\infty} f(x) = -1$

Note: In these exercises we use the result $\lim_{x \to \pm\infty} \frac{1}{x^{m/n}} = 0$ whenever $\frac{m}{n} > 0$. This result follows immediately from Theorem 12 and the power rule in Theorem 1: $\lim_{x \to \pm\infty} \left(\frac{1}{x^{m/n}}\right) = \lim_{x \to \pm\infty} \left(\frac{1}{x}\right)^{m/n} = \left(\lim_{x \to \pm\infty} \frac{1}{x}\right)^{m/n} = 0^{m/n} = 0.$

3. (a) -3
(b) -3

4. (a) π
(b) π

5. (a) $\frac{1}{2}$
(b) $\frac{1}{2}$

6. (a) $\frac{1}{8}$
(b) $\frac{1}{8}$

7. (a) $-\frac{5}{3}$
(b) $-\frac{5}{3}$

8. (a) $\frac{3}{4}$ (b) $\frac{3}{4}$

9. $-\frac{1}{x} \le \frac{\sin 2x}{x} \le \frac{1}{x} \Rightarrow \lim\limits_{x \to \infty} \frac{\sin 2x}{x} = 0$ by the Sandwich Theorem

10. $-\frac{1}{3\theta} \le \frac{\cos\theta}{3\theta} \le \frac{1}{3\theta} \Rightarrow \lim\limits_{\theta \to -\infty} \frac{\cos\theta}{3\theta} = 0$ by the Sandwich Theorem

11. $\lim\limits_{t \to \infty} \frac{2-t+\sin t}{t+\cos t} = \lim\limits_{t \to \infty} \frac{\frac{2}{t}-1+\left(\frac{\sin t}{t}\right)}{1+\left(\frac{\cos t}{t}\right)} = \frac{0-1+0}{1+0} = -1$

12. $\lim\limits_{r \to \infty} \frac{r+\sin r}{2r+7-5\sin r} = \lim\limits_{r \to \infty} \frac{1+\left(\frac{\sin r}{r}\right)}{2+\frac{7}{r}-5\left(\frac{\sin r}{r}\right)} = \lim\limits_{r \to \infty} \frac{1+0}{2+0-0} = \frac{1}{2}$

13. (a) $\lim\limits_{x \to \infty} \frac{2x+3}{5x+7} = \lim\limits_{x \to \infty} \frac{2+\frac{3}{x}}{5+\frac{7}{x}} = \frac{2}{5}$ (b) $\frac{2}{5}$ (same process as part (a))

14. (a) $\lim\limits_{x \to \infty} \frac{2x^3+7}{x^3-x^2+x+7} = \lim\limits_{x \to \infty} \frac{2+\left(\frac{7}{x^3}\right)}{1-\frac{1}{x}+\frac{1}{x^2}+\frac{7}{x^3}} = 2$
(b) 2 (same process as part (a))

15. (a) $\lim\limits_{x \to \infty} \frac{x+1}{x^2+3} = \lim\limits_{x \to \infty} \frac{\frac{1}{x}+\frac{1}{x^2}}{1+\frac{3}{x^2}} = 0$ (b) 0 (same process as part (a))

16. (a) $\lim\limits_{x \to \infty} \frac{3x+7}{x^2-2} = \lim\limits_{x \to \infty} \frac{\frac{3}{x}+\frac{7}{x^2}}{1-\frac{2}{x^2}} = 0$ (b) 0 (same process as part (a))

17. (a) $\lim\limits_{x \to \infty} \frac{7x^3}{x^3-3x^2+6x} = \lim\limits_{x \to \infty} \frac{7}{1-\frac{3}{x}+\frac{6}{x^2}} = 7$ (b) 7 (same process as part (a))

18. (a) $\lim\limits_{x \to \infty} \frac{1}{x^3-4x+1} = \lim\limits_{x \to \infty} \frac{\frac{1}{x^3}}{1-\frac{4}{x^2}+\frac{1}{x^3}} = 0$ (b) 0 (same process as part (a))

85. $\lim_{x \to \infty} \left(\sqrt{x^2+3x} - \sqrt{x^2-2x}\right) = \lim_{x \to \infty} \left[\sqrt{x^2+3x} - \sqrt{x^2-2x}\right] \cdot \left[\frac{\sqrt{x^2+3x}+\sqrt{x^2-2x}}{\sqrt{x^2+3x}+\sqrt{x^2-2x}}\right] = \lim_{x \to \infty} \frac{(x^2+3x)-(x^2-2x)}{\sqrt{x^2+3x}+\sqrt{x^2-2x}}$
$= \lim_{x \to \infty} \frac{5x}{\sqrt{x^2+3x}+\sqrt{x^2-2x}} = \lim_{x \to \infty} \frac{5}{\sqrt{1+\frac{3}{x}}+\sqrt{1-\frac{2}{x}}} = \frac{5}{1+1} = \frac{5}{2}$

86. $\lim_{x \to \infty} \sqrt{x^2+x} - \sqrt{x^2-x} = \lim_{x \to \infty} \left[\sqrt{x^2+x} - \sqrt{x^2-x}\right] \cdot \left[\frac{\sqrt{x^2+x}+\sqrt{x^2-x}}{\sqrt{x^2+x}+\sqrt{x^2-x}}\right] = \lim_{x \to \infty} \frac{(x^2+x)-(x^2-x)}{\sqrt{x^2+x}+\sqrt{x^2-x}}$
$= \lim_{x \to \infty} \frac{2x}{\sqrt{x^2+x}+\sqrt{x^2-x}} = \lim_{x \to \infty} \frac{2}{\sqrt{1+\frac{1}{x}}+\sqrt{1-\frac{1}{x}}} = \frac{2}{1+1} = 1$

87. For any $\epsilon > 0$, take $N = 1$. Then for all $x > N$ we have that $|f(x) - k| = |k - k| = 0 < \epsilon$.

88. For any $\epsilon > 0$, take $N = 1$. Then for all $y < -N$ we have that $|f(x) - k| = |k - k| = 0 < \epsilon$.

89. For every real number $-B < 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - 0| < \delta \Rightarrow \frac{-1}{x^2} < -B$. Now, $-\frac{1}{x^2} < -B < 0 \Leftrightarrow \frac{1}{x^2} > B > 0 \Leftrightarrow x^2 < \frac{1}{B} \Leftrightarrow |x| < \frac{1}{\sqrt{B}}$. Choose $\delta = \frac{1}{\sqrt{B}}$, then $0 < |x| < \delta \Rightarrow |x| < \frac{1}{\sqrt{B}}$ $\Rightarrow \frac{-1}{x^2} < -B$ so that $\lim_{x \to 0} -\frac{1}{x^2} = -\infty$.

90. For every real number $B > 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - 0| < \delta \Rightarrow \frac{1}{|x|} > B$. Now, $\frac{1}{|x|} > B > 0 \Leftrightarrow |x| < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $0 < |x - 0| < \delta \Rightarrow |x| < \frac{1}{B} \Rightarrow \frac{1}{|x|} > B$ so that $\lim_{x \to 0} \frac{1}{|x|} = \infty$.

91. For every real number $-B < 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - 3| < \delta \Rightarrow \frac{-2}{(x-3)^2} < -B$. Now, $\frac{-2}{(x-3)^2} < -B < 0 \Leftrightarrow \frac{2}{(x-3)^2} > B > 0 \Leftrightarrow \frac{(x-3)^2}{2} < \frac{1}{B} \Leftrightarrow (x-3)^2 < \frac{2}{B} \Leftrightarrow 0 < |x - 3| < \sqrt{\frac{2}{B}}$. Choose $\delta = \sqrt{\frac{2}{B}}$, then $0 < |x - 3| < \delta \Rightarrow \frac{-2}{(x-3)^2} < -B < 0$ so that $\lim_{x \to 3} \frac{-2}{(x-3)^2} = -\infty$.

92. For every real number $B > 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - (-5)| < \delta \Rightarrow \frac{1}{(x+5)^2} > B$. Now, $\frac{1}{(x+5)^2} > B > 0 \Leftrightarrow (x+5)^2 < \frac{1}{B} \Leftrightarrow |x + 5| < \frac{1}{\sqrt{B}}$. Choose $\delta = \frac{1}{\sqrt{B}}$. Then $0 < |x - (-5)| < \delta \Rightarrow |x + 5| < \frac{1}{\sqrt{B}} \Rightarrow \frac{1}{(x+5)^2} > B$ so that $\lim_{x \to -5} \frac{1}{(x+5)^2} = \infty$.

93. (a) We say that f(x) approaches infinity as x approaches c from the left, and write $\lim_{x \to c^-} f(x) = \infty$, if for every positive number B, there exists a corresponding number $\delta > 0$ such that for all x, $c - \delta < x < c \Rightarrow f(x) > B$.

(b) We say that f(x) approaches minus infinity as x approaches c from the right, and write $\lim_{x \to c^+} f(x) = -\infty$, if for every positive number B (or negative number $-B$) there exists a corresponding number $\delta > 0$ such that for all x, $c < x < c + \delta \Rightarrow f(x) < -B$.

(c) We say that f(x) approaches minus infinity as x approaches c from the left, and write $\lim_{x \to c^-} f(x) = -\infty$, if for every positive number B (or negative number $-B$) there exists a corresponding number $\delta > 0$ such that for all x, $c - \delta < x < c \Rightarrow f(x) < -B$.

94. For $B > 0$, $\frac{1}{x} > B > 0 \Leftrightarrow x < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $0 < x < \delta \Rightarrow 0 < x < \frac{1}{B} \Rightarrow \frac{1}{x} > B$ so that $\lim_{x \to 0^+} \frac{1}{x} = \infty$.

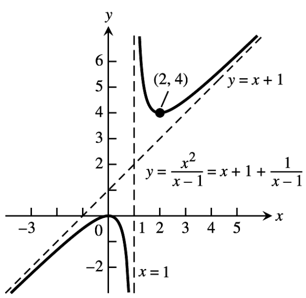
95. For $B > 0$, $\frac{1}{x} < -B < 0 \Leftrightarrow -\frac{1}{x} > B > 0 \Leftrightarrow -x < \frac{1}{B} \Leftrightarrow -\frac{1}{B} < x$. Choose $\delta = \frac{1}{B}$. Then $-\delta < x < 0 \Rightarrow -\frac{1}{B} < x \Rightarrow \frac{1}{x} < -B$ so that $\lim_{x \to 0^-} \frac{1}{x} = -\infty$.

96. For $B > 0$, $\frac{1}{x-2} < -B \Leftrightarrow -\frac{1}{x-2} > B \Leftrightarrow -(x-2) < \frac{1}{B} \Leftrightarrow x - 2 > -\frac{1}{B} \Leftrightarrow x > 2 - \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $2 - \delta < x < 2 \Rightarrow -\delta < x - 2 < 0 \Rightarrow -\frac{1}{B} < x - 2 < 0 \Rightarrow \frac{1}{x-2} < -B < 0$ so that $\lim_{x \to 2^-} \frac{1}{x-2} = -\infty$.

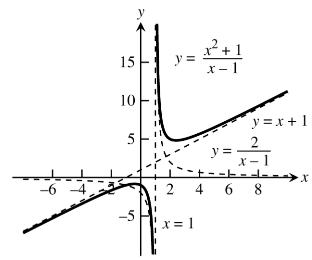
97. For $B > 0$, $\frac{1}{x-2} > B \Leftrightarrow 0 < x - 2 < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $2 < x < 2 + \delta \Rightarrow 0 < x - 2 < \delta \Rightarrow 0 < x - 2 < \frac{1}{B} \Rightarrow \frac{1}{x-2} > B > 0$ so that $\lim_{x \to 2^+} \frac{1}{x-2} = \infty$.

98. For $B > 0$ and $0 < x < 1$, $\frac{1}{1-x^2} > B \Leftrightarrow 1 - x^2 < \frac{1}{B} \Leftrightarrow (1-x)(1+x) < \frac{1}{B}$. Now $\frac{1+x}{2} < 1$ since $x < 1$. Choose $\delta < \frac{1}{2B}$. Then $1 - \delta < x < 1 \Rightarrow -\delta < x - 1 < 0 \Rightarrow 1 - x < \delta < \frac{1}{2B} \Rightarrow (1-x)(1+x) < \frac{1}{B}\left(\frac{1+x}{2}\right) < \frac{1}{B}$ $\Rightarrow \frac{1}{1-x^2} > B$ for $0 < x < 1$ and x near 1 $\Rightarrow \lim_{x \to 1^-} \frac{1}{1-x^2} = \infty$.

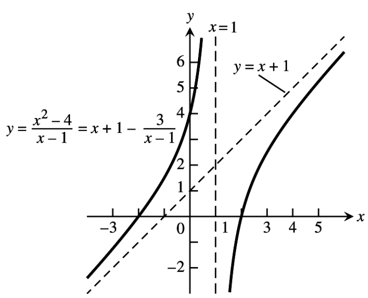
99. $y = \frac{x^2}{x-1} = x + 1 + \frac{1}{x-1}$



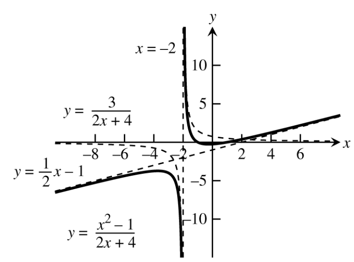
100. $y = \frac{x^2+1}{x-1} = x + 1 + \frac{2}{x-1}$



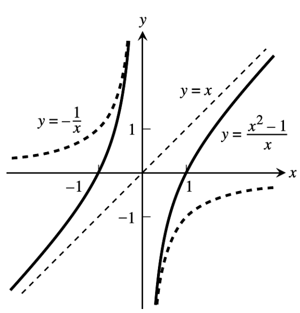
101. $y = \frac{x^2-4}{x-1} = x + 1 - \frac{3}{x-1}$



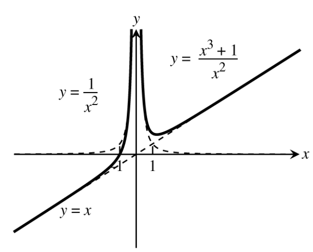
102. $y = \frac{x^2-1}{2x+4} = \frac{1}{2}x - 1 + \frac{3}{2x+4}$



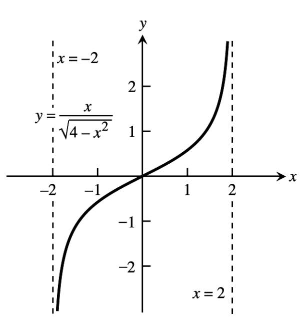
103. $y = \frac{x^2-1}{x} = x - \frac{1}{x}$



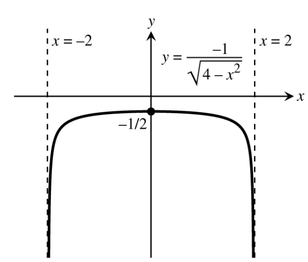
104. $y = \frac{x^3+1}{x^2} = x + \frac{1}{x^2}$



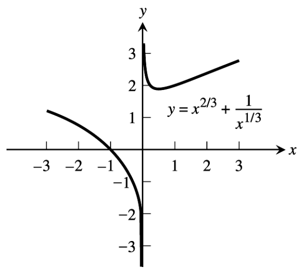
105. $y = \frac{x}{\sqrt{4-x^2}}$



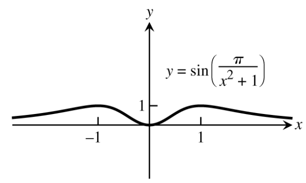
106. $y = \frac{-1}{\sqrt{4-x^2}}$



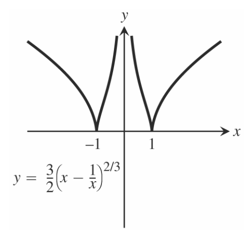
107. $y = x^{2/3} + \frac{1}{x^{1/3}}$



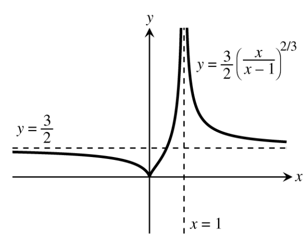
108. $y = \sin\left(\frac{\pi}{x^2+1}\right)$



109. (a) $y \to \infty$ (see accompanying graph)
(b) $y \to \infty$ (see accompanying graph)
(c) cusps at $x = \pm 1$ (see accompanying graph)

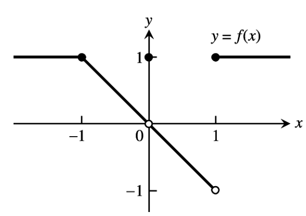


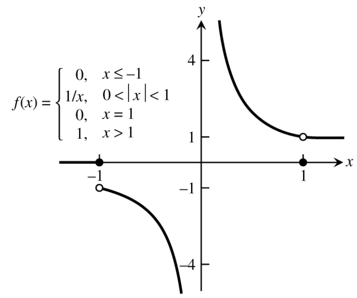
110. (a) $y \to 0$ and a cusp at $x = 0$ (see the accompanying graph)
(b) $y \to \frac{3}{2}$ (see accompanying graph)
(c) a vertical asymptote at $x = 1$ and contains the point $\left(-1, \frac{3}{2\sqrt[3]{4}}\right)$ (see accompanying graph)



CHAPTER 2 PRACTICE EXERCISES

1. At $x = -1$: $\lim_{x \to -1^-} f(x) = \lim_{x \to -1^+} f(x) = 1$
$\Rightarrow \lim_{x \to -1} f(x) = 1 = f(-1)$
$\Rightarrow$ f is continuous at $x = -1$.
At $x = 0$: $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^+} f(x) = 0 \Rightarrow \lim_{x \to 0} f(x) = 0$.
But $f(0) = 1 \neq \lim_{x \to 0} f(x)$
$\Rightarrow$ f is discontinuous at $x = 0$.
If we define $f(0) = 0$, then the discontinuity at $x = 0$ is removable.
At $x = 1$: $\lim_{x \to 1^-} f(x) = -1$ and $\lim_{x \to 1^+} f(x) = 1$
$\Rightarrow \lim_{x \to 1} f(x)$ does not exist
$\Rightarrow$ f is discontinuous at $x = 1$.





2. At $x = -1$: $\lim_{x \to -1^-} f(x) = 0$ and $\lim_{x \to -1^+} f(x) = -1$
   $\Rightarrow \lim_{x \to -1} f(x)$ does not exist
   $\Rightarrow$ f is discontinuous at $x = -1$.
   At $x = 0$: $\lim_{x \to 0^-} f(x) = -\infty$ and $\lim_{x \to 0^+} f(x) = \infty$
   $\Rightarrow \lim_{x \to 0} f(x)$ does not exist
   $\Rightarrow$ f is discontinuous at $x = 0$.
   At $x = 1$: $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} f(x) = 1 \Rightarrow \lim_{x \to 1} f(x) = 1$.
   But $f(1) = 0 \neq \lim_{x \to 1} f(x)$
   $\Rightarrow$ f is discontinuous at $x = 1$.
   If we define $f(1) = 1$, then the discontinuity at $x = 1$ is removable.

3. (a) $\lim_{t \to t_0} (3f(t)) = 3 \lim_{t \to t_0} f(t) = 3(-7) = -21$
   (b) $\lim_{t \to t_0} (f(t))^2 = \left(\lim_{t \to t_0} f(t)\right)^2 = (-7)^2 = 49$
   (c) $\lim_{t \to t_0} (f(t) \cdot g(t)) = \lim_{t \to t_0} f(t) \cdot \lim_{t \to t_0} g(t) = (-7)(0) = 0$
   (d) $\lim_{t \to t_0} \frac{f(t)}{g(t)-7} = \frac{\lim_{t \to t_0} f(t)}{\lim_{t \to t_0} (g(t) - 7)} = \frac{\lim_{t \to t_0} f(t)}{\lim_{t \to t_0} g(t) - \lim_{t \to t_0} 7} = \frac{-7}{0-7} = 1$
   (e) $\lim_{t \to t_0} \cos(g(t)) = \cos\left(\lim_{t \to t_0} g(t)\right) = \cos 0 = 1$
   (f) $\lim_{t \to t_0} |f(t)| = \left|\lim_{t \to t_0} f(t)\right| = |-7| = 7$
   (g) $\lim_{t \to t_0} (f(t) + g(t)) = \lim_{t \to t_0} f(t) + \lim_{t \to t_0} g(t) = -7 + 0 = -7$
   (h) $\lim_{t \to t_0} \left(\frac{1}{f(t)}\right) = \frac{1}{\lim_{t \to t_0} f(t)} = \frac{1}{-7} = -\frac{1}{7}$

4. (a) $\lim_{x \to 0} -g(x) = -\lim_{x \to 0} g(x) = -\sqrt{2}$
   (b) $\lim_{x \to 0} (g(x) \cdot f(x)) = \lim_{x \to 0} g(x) \cdot \lim_{x \to 0} f(x) = \left(\sqrt{2}\right)\left(\frac{1}{2}\right) = \frac{\sqrt{2}}{2}$
   (c) $\lim_{x \to 0} (f(x) + g(x)) = \lim_{x \to 0} f(x) + \lim_{x \to 0} g(x) = \frac{1}{2} + \sqrt{2}$
   (d) $\lim_{x \to 0} \frac{1}{f(x)} = \frac{1}{\lim_{x \to 0} f(x)} = \frac{1}{\frac{1}{2}} = 2$
   (e) $\lim_{x \to 0} (x + f(x)) = \lim_{x \to 0} x + \lim_{x \to 0} f(x) = 0 + \frac{1}{2} = \frac{1}{2}$
   (f) $\lim_{x \to 0} \frac{f(x) \cdot \cos x}{x-1} = \frac{\lim_{x \to 0} f(x) \cdot \lim_{x \to 0} \cos x}{\lim_{x \to 0} x - \lim_{x \to 0} 1} = \frac{\left(\frac{1}{2}\right)(1)}{0-1} = -\frac{1}{2}$

5. Since $\lim_{x \to 0} x = 0$ we must have that $\lim_{x \to 0} (4 - g(x)) = 0$. Otherwise, if $\lim_{x \to 0} (4 - g(x))$ is a finite positive number, we would have $\lim_{x \to 0^-} \left[\frac{4-g(x)}{x}\right] = -\infty$ and $\lim_{x \to 0^+} \left[\frac{4-g(x)}{x}\right] = \infty$ so the limit could not equal 1 as $x \to 0$. Similar reasoning holds if $\lim_{x \to 0} (4 - g(x))$ is a finite negative number. We conclude that $\lim_{x \to 0} g(x) = 4$.

6. $2 = \lim_{x \to -4} \left[x \lim_{x \to 0} g(x)\right] = \lim_{x \to -4} x \cdot \lim_{x \to -4} \left[\lim_{x \to 0} g(x)\right] = -4 \lim_{x \to -4} \left[\lim_{x \to 0} g(x)\right] = -4 \lim_{x \to 0} g(x)$ (since $\lim_{x \to 0} g(x)$ is a constant) $\Rightarrow \lim_{x \to 0} g(x) = \frac{2}{-4} = -\frac{1}{2}$.

7. (a) $\lim_{x \to c} f(x) = \lim_{x \to c} x^{1/3} = c^{1/3} = f(c)$ for every real number c $\Rightarrow$ f is continuous on $(-\infty, \infty)$.
   (b) $\lim_{x \to c} g(x) = \lim_{x \to c} x^{3/4} = c^{3/4} = g(c)$ for every nonnegative real number c $\Rightarrow$ g is continuous on $[0, \infty)$.

(c) $\lim_{x \to c} h(x) = \lim_{x \to c} x^{-2/3} = \frac{1}{c^{2/3}} = h(c)$ for every nonzero real number c $\Rightarrow$ h is continuous on $(-\infty, 0)$ and $(-\infty, \infty)$.

(d) $\lim_{x \to c} k(x) = \lim_{x \to c} x^{-1/6} = \frac{1}{c^{1/6}} = k(c)$ for every positive real number c $\Rightarrow$ k is continuous on $(0, \infty)$

8. (a) $\bigcup_{n \in I} \left(\left(n - \frac{1}{2}\right)\pi, \left(n + \frac{1}{2}\right)\pi\right)$, where I = the set of all integers.

(b) $\bigcup_{n \in I} (n\pi, (n+1)\pi)$, where I = the set of all integers.

(c) $(-\infty, \pi) \cup (\pi, \infty)$

(d) $(-\infty, 0) \cup (0, \infty)$

9. (a) $\lim_{x \to 0} \frac{x^2 - 4x + 4}{x^3 + 5x^2 - 14x} = \lim_{x \to 0} \frac{(x-2)(x-2)}{x(x+7)(x-2)} = \lim_{x \to 0} \frac{x-2}{x(x+7)}$, $x \neq 2$; the limit does not exist because $\lim_{x \to 0^-} \frac{x-2}{x(x+7)} = \infty$ and $\lim_{x \to 0^+} \frac{x-2}{x(x+7)} = -\infty$

(b) $\lim_{x \to 2} \frac{x^2 - 4x + 4}{x^3 + 5x^2 - 14x} = \lim_{x \to 2} \frac{(x-2)(x-2)}{x(x+7)(x-2)} = \lim_{x \to 2} \frac{x-2}{x(x+7)}$, $x \neq 2$, and $\lim_{x \to 2} \frac{x-2}{x(x+7)} = \frac{0}{2(9)} = 0$

10. (a) $\lim_{x \to 0} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \lim_{x \to 0} \frac{x(x+1)}{x^3(x^2 + 2x + 1)} = \lim_{x \to 0} \frac{x+1}{x^2(x+1)(x+1)} = \lim_{x \to 0} \frac{1}{x^2(x+1)}$, $x \neq 0$ and $x \neq -1$.
Now $\lim_{x \to 0^-} \frac{1}{x^2(x+1)} = \infty$ and $\lim_{x \to 0^+} \frac{1}{x^2(x+1)} = \infty \Rightarrow \lim_{x \to 0} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \infty$.

(b) $\lim_{x \to -1} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \lim_{x \to -1} \frac{x(x+1)}{x^3(x^2 + 2x + 1)} = \lim_{x \to -1} \frac{1}{x^2(x+1)}$, $x \neq 0$ and $x \neq -1$. The limit does not exist because $\lim_{x \to -1^-} \frac{1}{x^2(x+1)} = -\infty$ and $\lim_{x \to -1^+} \frac{1}{x^2(x+1)} = \infty$.

11. $\lim_{x \to 1} \frac{1 - \sqrt{x}}{1 - x} = \lim_{x \to 1} \frac{1 - \sqrt{x}}{(1 - \sqrt{x})(1 + \sqrt{x})} = \lim_{x \to 1} \frac{1}{1 + \sqrt{x}} = \frac{1}{2}$

12. $\lim_{x \to a} \frac{x^2 - a^2}{x^4 - a^4} = \lim_{x \to a} \frac{(x^2 - a^2)}{(x^2 + a^2)(x^2 - a^2)} = \lim_{x \to a} \frac{1}{x^2 + a^2} = \frac{1}{2a^2}$

13. $\lim_{h \to 0} \frac{(x+h)^2 - x^2}{h} = \lim_{h \to 0} \frac{(x^2 + 2hx + h^2) - x^2}{h} = \lim_{h \to 0} (2x + h) = 2x$

14. $\lim_{x \to 0} \frac{(x+h)^2 - x^2}{h} = \lim_{x \to 0} \frac{(x^2 + 2hx + h^2) - x^2}{h} = \lim_{x \to 0} (2x + h) = h$

15. $\lim_{x \to 0} \frac{\frac{1}{2+x} - \frac{1}{2}}{x} = \lim_{x \to 0} \frac{2 - (2+x)}{2x(2+x)} = \lim_{x \to 0} \frac{-1}{4 + 2x} = -\frac{1}{4}$

16. $\lim_{x \to 0} \frac{(2+x)^3 - 8}{x} = \lim_{x \to 0} \frac{(x^3 + 6x^2 + 12x + 8) - 8}{x} = \lim_{x \to 0} (x^2 + 6x + 12) = 12$

17. $\lim_{x \to 1} \frac{x^{1/3} - 1}{\sqrt{x} - 1} = \lim_{x \to 1} \frac{(x^{1/3} - 1)}{(\sqrt{x} - 1)} \cdot \frac{(x^{2/3} + x^{1/3} + 1)(\sqrt{x} + 1)}{(\sqrt{x} + 1)(x^{2/3} + x^{1/3} + 1)} = \lim_{x \to 1} \frac{(x-1)(\sqrt{x} + 1)}{(x-1)(x^{2/3} + x^{1/3} + 1)} = \lim_{x \to 1} \frac{\sqrt{x} + 1}{x^{2/3} + x^{1/3} + 1}$
$= \frac{1+1}{1+1+1} = \frac{2}{3}$

18. $\lim_{x \to 64} \frac{x^{2/3} - 16}{\sqrt{x} - 8} = \lim_{x \to 64} \frac{(x^{1/3} - 4)(x^{1/3} + 4)}{\sqrt{x} - 8} = \lim_{x \to 64} \frac{(x^{1/3} - 4)(x^{1/3} + 4)}{\sqrt{x} - 8} \cdot \frac{(x^{2/3} + 4x^{1/3} + 16)(\sqrt{x} + 8)}{(\sqrt{x} + 8)(x^{2/3} + 4x^{1/3} + 16)}$
$= \lim_{x \to 64} \frac{(x - 64)(x^{1/3} + 4)(\sqrt{x} + 8)}{(x - 64)(x^{2/3} + 4x^{1/3} + 16)} = \lim_{x \to 64} \frac{(x^{1/3} + 4)(\sqrt{x} + 8)}{x^{2/3} + 4x^{1/3} + 16} = \frac{(4+4)(8+8)}{16 + 16 + 16} = \frac{8}{3}$

19. $\lim_{x \to 0} \frac{\tan 2x}{\tan \pi x} = \lim_{x \to 0} \frac{\sin 2x}{\cos 2x} \cdot \frac{\cos \pi x}{\sin \pi x} = \lim_{x \to 0} \left(\frac{\sin 2x}{2x}\right)\left(\frac{\cos \pi x}{\cos 2x}\right)\left(\frac{\pi x}{\sin \pi x}\right)\left(\frac{2x}{\pi x}\right) = 1 \cdot 1 \cdot 1 \cdot \frac{2}{\pi} = \frac{2}{\pi}$

20. $\lim_{x \to \pi^-} \csc x = \lim_{x - \pi^-} \frac{1}{\sin x} = \infty$

21. $\lim\limits_{x \to \pi} \sin\left(\frac{x}{2} + \sin x\right) = \sin\left(\frac{\pi}{2} + \sin \pi\right) = \sin\left(\frac{\pi}{2}\right) = 1$

22. $\lim\limits_{x \to \pi} \cos^2(x - \tan x) = \cos^2(\pi - \tan \pi) = \cos^2(\pi) = (-1)^2 = 1$

23. $\lim\limits_{x \to 0} \frac{8x}{3\sin x - x} = \lim\limits_{x \to 0} \frac{8}{3\frac{\sin x}{x} - 1} = \frac{8}{3(1) - 1} = 4$

24. $\lim\limits_{x \to 0} \frac{\cos 2x - 1}{\sin x} = \lim\limits_{x \to 0} \left(\frac{\cos 2x - 1}{\sin x} \cdot \frac{\cos 2x + 1}{\cos 2x + 1}\right) = \lim\limits_{x \to 0} \frac{\cos^2 2x - 1}{\sin x(\cos 2x + 1)} = \lim\limits_{x \to 0} \frac{-\sin^2 2x}{\sin x(\cos 2x + 1)} = \lim\limits_{x \to 0} \frac{-4\sin x \cos^2 x}{\cos 2x + 1} = \frac{-4(0)(1)^2}{1 + 1} = 0$

25. Let $x = t - 3 \Rightarrow \lim\limits_{t \to 3^+} \ln(t - 3) = \lim\limits_{x \to 0^+} \ln x = -\infty$

26. $\lim\limits_{t \to 1} t^2 \ln\left(2 - \sqrt{t}\right) = \ln 1 = 0$

27. $-1 \le \cos\left(\frac{\pi}{\theta}\right) \le 1 \Rightarrow e^{-1} \le e^{\cos(\pi/\theta)} \le e^1 \Rightarrow \sqrt{\theta}\, e^{-1} \le \sqrt{\theta}\, e^{\cos(\pi/\theta)} \le \sqrt{\theta}\, e \Rightarrow \lim\limits_{\theta \to 0^+} \sqrt{\theta}\, e^{\cos(\pi/\theta)} = 0$ by the Sandwich Theorem

28. $\lim\limits_{z \to 0^+} \frac{2e^{1/z}}{e^{1/z} + 1} = \lim\limits_{z \to 0^+} \frac{2}{1 + e^{-1/z}} = \frac{2}{1 + 0} = 2$

29. $\lim\limits_{x \to 0^+} [4\, g(x)]^{1/3} = 2 \Rightarrow \left[\lim\limits_{x \to 0^+} 4\, g(x)\right]^{1/3} = 2 \Rightarrow \lim\limits_{x \to 0^+} 4\, g(x) = 8$, since $2^3 = 8$. Then $\lim\limits_{x \to 0^+} g(x) = 2$.

30. $\lim\limits_{x \to \sqrt{5}} \frac{1}{x + g(x)} = 2 \Rightarrow \lim\limits_{x \to \sqrt{5}} (x + g(x)) = \frac{1}{2} \Rightarrow \sqrt{5} + \lim\limits_{x \to \sqrt{5}} g(x) = \frac{1}{2} \Rightarrow \lim\limits_{x \to \sqrt{5}} g(x) = \frac{1}{2} - \sqrt{5}$

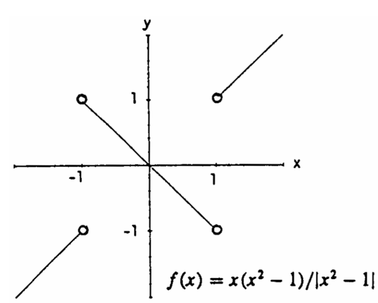
31. $\lim\limits_{x \to 1} \frac{3x^2 + 1}{g(x)} = \infty \Rightarrow \lim\limits_{x \to 1} g(x) = 0$ since $\lim\limits_{x \to 1} (3x^2 + 1) = 4$

32. $\lim\limits_{x \to -2} \frac{5 - x^2}{\sqrt{g(x)}} = 0 \Rightarrow \lim\limits_{x \to -2} g(x) = \infty$ since $\lim\limits_{x \to -2} (5 - x^2) = 1$

33. (a) $f(-1) = -1$ and $f(2) = 5 \Rightarrow$ f has a root between -1 and 2 by the Intermediate Value Theorem.
(b), (c) root is 1.32471795724

34. (a) $f(-2) = -2$ and $f(0) = 2 \Rightarrow$ f has a root between -2 and 0 by the Intermediate Value Theorem.
(b), (c) root is -1.76929235424

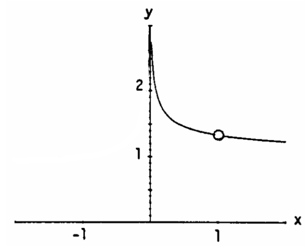
35. At $x = -1$: $\lim\limits_{x \to -1^-} f(x) = \lim\limits_{x \to -1^-} \frac{x(x^2 - 1)}{|x^2 - 1|}$
$= \lim\limits_{x \to -1^-} \frac{x(x^2 - 1)}{x^2 - 1} = \lim\limits_{x \to -1^-} x = -1$, and
$\lim\limits_{x \to -1^+} f(x) = \lim\limits_{x \to -1^+} \frac{x(x^2 - 1)}{|x^2 - 1|} = \lim\limits_{x \to -1^+} \frac{x(x^2 - 1)}{-(x^2 - 1)}$
$= \lim\limits_{x \to -1} (-x) = -(-1) = 1$. Since
$\lim\limits_{x \to -1^-} f(x) \ne \lim\limits_{x \to -1^+} f(x)$
$\Rightarrow \lim\limits_{x \to -1} f(x)$ does not exist, the function f cannot be extended to a continuous function at $x = -1$.



At $x = 1$: $\lim\limits_{x \to 1^-} f(x) = \lim\limits_{x \to 1^-} \frac{x\,(x^2-1)}{|x^2-1|} = \lim\limits_{x \to 1^-} \frac{x\,(x^2-1)}{-\,(x^2-1)} = \lim\limits_{x \to 1^-} (-x) = -1$, and $\lim\limits_{x \to 1^+} f(x) = \lim\limits_{x \to 1^+} \frac{x\,(x^2-1)}{|x^2-1|} = \lim\limits_{x \to 1^+} \frac{x\,(x^2-1)}{x^2-1} = \lim\limits_{x \to 1^+} x = 1$. Again $\lim\limits_{x \to 1} f(x)$ does not exist so f <u>cannot</u> be extended to a continuous function at $x = 1$ either.

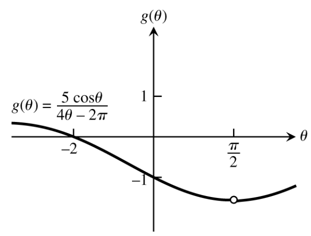
36. The discontinuity at $x = 0$ of $f(x) = \sin\left(\frac{1}{x}\right)$ is nonremovable because $\lim\limits_{x \to 0} \sin\frac{1}{x}$ does not exist.

37. Yes, f does have a continuous extension to $a = 1$: define $f(1) = \lim\limits_{x \to 1} \frac{x-1}{x-\sqrt[4]{x}} = \frac{4}{3}$.

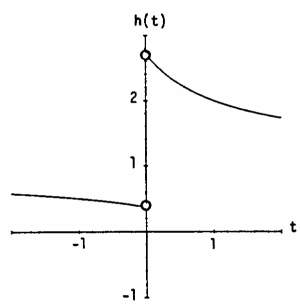


$f(x) = \frac{x-1}{x-\sqrt[4]{x}}, \quad a = 1$

38. Yes, g does have a continuous extension to $a = \frac{\pi}{2}$: $g\left(\frac{\pi}{2}\right) = \lim\limits_{\theta \to \frac{\pi}{2}} \frac{5\cos\theta}{4\theta - 2\pi} = -\frac{5}{4}$.

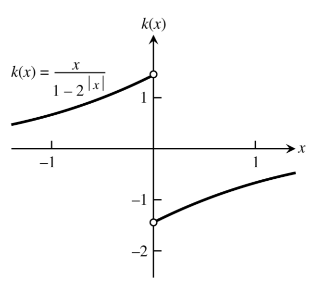


39. From the graph we see that $\lim\limits_{t \to 0^-} h(t) \neq \lim\limits_{t \to 0^+} h(t)$ so h <u>cannot</u> be extended to a continuous function at $a = 0$.



$h(t) = (1 + |t|)^{1/t}, \quad a = 0$

40. From the graph we see that $\lim\limits_{x \to 0^-} k(x) \neq \lim\limits_{x \to 0^+} k(x)$ so k <u>cannot</u> be extended to a continuous function at $a = 0$.



41. $\lim\limits_{x \to \infty} \frac{2x+3}{5x+7} = \lim\limits_{x \to \infty} \frac{2+\frac{3}{x}}{5+\frac{7}{x}} = \frac{2+0}{5+0} = \frac{2}{5}$

42. $\lim\limits_{x \to -\infty} \frac{2x^2+3}{5x^2+7} = \lim\limits_{x \to -\infty} \frac{2+\frac{3}{x^2}}{5+\frac{7}{x^2}} = \frac{2+0}{5+0} = \frac{2}{5}$

43. $\lim\limits_{x \to -\infty} \frac{x^2-4x+8}{3x^3} = \lim\limits_{x \to -\infty} \left(\frac{1}{3x} - \frac{4}{3x^2} + \frac{8}{3x^3}\right) = 0 - 0 + 0 = 0$

44. $\lim\limits_{x\to\infty}\frac{1}{x^2-7x+1}=\lim\limits_{x\to\infty}\frac{\frac{1}{x^2}}{1-\frac{7}{x}+\frac{1}{x^2}}=\frac{0}{1-0+0}=0$

45. $\lim\limits_{x\to-\infty}\frac{x^2-7x}{x+1}=\lim\limits_{x\to-\infty}\frac{x-7}{1+\frac{1}{x}}=-\infty$

46. $\lim\limits_{x\to\infty}\frac{x^4+x^3}{12x^3+128}=\lim\limits_{x\to-\infty}\frac{x+1}{12+\frac{128}{x^3}}=\infty$

47. $\lim\limits_{x\to\infty}\frac{\sin x}{\lfloor x\rfloor}\le\lim\limits_{x\to\infty}\frac{1}{\lfloor x\rfloor}=0$ since $\lfloor x\rfloor\to\infty$ as $x\to\infty\Rightarrow\lim\limits_{x\to\infty}\frac{\sin x}{\lfloor x\rfloor}=0.$

48. $\lim\limits_{\theta\to\infty}\frac{\cos\theta-1}{\theta}\le\lim\limits_{\theta\to\infty}\frac{2}{\theta}=0\Rightarrow\lim\limits_{\theta\to\infty}\frac{\cos\theta-1}{\theta}=0.$

49. $\lim\limits_{x\to\infty}\frac{x+\sin x+2\sqrt{x}}{x+\sin x}=\lim\limits_{x\to\infty}\frac{1+\frac{\sin x}{x}+\frac{2}{\sqrt{x}}}{1+\frac{\sin x}{x}}=\frac{1+0+0}{1+0}=1$

50. $\lim\limits_{x\to\infty}\frac{x^{2/3}+x^{-1}}{x^{2/3}+\cos^2 x}=\lim\limits_{x\to\infty}\left(\frac{1+x^{-5/3}}{1+\frac{\cos^2 x}{x^{2/3}}}\right)=\frac{1+0}{1+0}=1$

51. $\lim\limits_{x\to\infty}e^{1/x}\cos\left(\frac{1}{x}\right)=e^0\cdot\cos(0)=1\cdot1=1$

52. $\lim\limits_{t\to\infty}\ln\left(1+\frac{1}{t}\right)=\ln 1=0$

53. $\lim\limits_{x\to-\infty}\tan^{-1}x=-\frac{\pi}{2}$

54. $\lim\limits_{t\to-\infty}e^{3t}\sin^{-1}\left(\frac{1}{t}\right)=0\cdot\sin^{-1}(0)=0\cdot0=0$

55. (a) $y=\frac{x^2+4}{x-3}$ is undefined at $x=3$: $\lim\limits_{x\to3^-}\frac{x^2+4}{x-3}=-\infty$ and $\lim\limits_{x\to3^+}\frac{x^2+4}{x-3}=+\infty$, thus $x=3$ is a vertical asymptote.

(b) $y=\frac{x^2-x-2}{x^2-2x+1}$ is undefined at $x=1$: $\lim\limits_{x\to1^-}\frac{x^2-x-2}{x^2-2x+1}=-\infty$ and $\lim\limits_{x\to1^+}\frac{x^2-x-2}{x^2-2x+1}=-\infty$, thus $x=1$ is a vertical asymptote.

(c) $y=\frac{x^2+x-6}{x^2+2x-8}$ is undefined at $x=2$ and -4: $\lim\limits_{x\to2}\frac{x^2+x-6}{x^2+2x-8}=\lim\limits_{x\to2}\frac{x+3}{x+4}=\frac{5}{6}$; $\lim\limits_{x\to-4^-}\frac{x^2+x-6}{x^2+2x-8}=\lim\limits_{x\to-4^-}\frac{x+3}{x+4}=\infty$ $\lim\limits_{x\to-4^+}\frac{x^2+x-6}{x^2+2x-8}=\lim\limits_{x\to-4^+}\frac{x+3}{x+4}=-\infty$. Thus $x=-4$ is a vertical asymptote.

56. (a) $y=\frac{1-x^2}{x^2+1}$: $\lim\limits_{x\to\infty}\frac{1-x^2}{x^2+1}=\lim\limits_{x\to\infty}\frac{\frac{1}{x^2}-1}{1+\frac{1}{x^2}}=\frac{-1}{1}=-1$ and $\lim\limits_{x\to-\infty}\frac{1-x^2}{x^2+1}=\lim\limits_{x\to-\infty}\frac{\frac{1}{x^2}-1}{1+\frac{1}{x^2}}=\frac{-1}{1}=-1$, thus $y=-1$ is a horizontal asymptote.

(b) $y=\frac{\sqrt{x}+4}{\sqrt{x+4}}$: $\lim\limits_{x\to\infty}\frac{\sqrt{x}+4}{\sqrt{x+4}}=\lim\limits_{x\to\infty}\frac{1+\frac{4}{\sqrt{x}}}{\sqrt{1+\frac{4}{x}}}=\frac{1+0}{\sqrt{1+0}}=1$, thus $y=1$ is a horizontal asymptote.

(c) $y=\frac{\sqrt{x^2+4}}{x}$: $\lim\limits_{x\to\infty}\frac{\sqrt{x^2+4}}{x}=\lim\limits_{x\to\infty}\frac{\sqrt{1+\frac{4}{x^2}}}{1}=\frac{\sqrt{1+0}}{1}=1$ and $\lim\limits_{x\to-\infty}\frac{\sqrt{x^2+4}}{x}=\lim\limits_{x\to-\infty}\frac{\sqrt{1+\frac{4}{x^2}}}{\frac{x}{\sqrt{x^2}}}=\lim\limits_{x\to-\infty}\frac{\sqrt{1+\frac{4}{x^2}}}{\frac{x}{-x}}$ $=\lim\limits_{x\to-\infty}\frac{\sqrt{1+\frac{4}{x^2}}}{-1}=\frac{\sqrt{1+0}}{-1}=\frac{1}{-1}=-1$, thus $y=1$ and $y=-1$ are horizontal asymptotes.

(d) $y=\sqrt{\frac{x^2+9}{9x^2+1}}$: $\lim\limits_{x\to\infty}\sqrt{\frac{x^2+9}{9x^2+1}}=\lim\limits_{x\to\infty}\sqrt{\frac{1+\frac{9}{x^2}}{9+\frac{1}{x^2}}}=\sqrt{\frac{1+0}{9+0}}=\frac{1}{3}$ and $\lim\limits_{x\to-\infty}\sqrt{\frac{x^2+9}{9x^2+1}}=\lim\limits_{x\to-\infty}\sqrt{\frac{1+\frac{9}{x^2}}{9+\frac{1}{x^2}}}=\sqrt{\frac{1+0}{9+0}}=\frac{1}{3}$, thus $y=\frac{1}{3}$ is a horizontal asymptote.

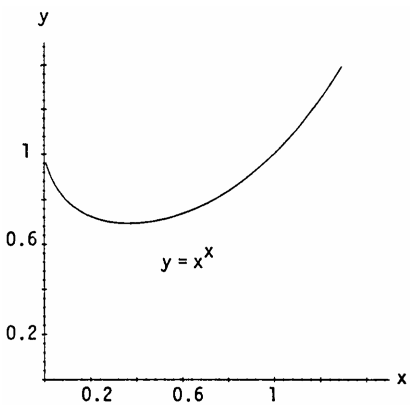
CHAPTER 2 ADDITIONAL AND ADVANCED EXERCISES

1. (a)

x	0.1	0.01	0.001	0.0001	0.00001
x^x	0.7943	0.9550	0.9931	0.9991	0.9999

Apparently, $\lim\limits_{x \to 0^+} x^x = 1$

(b)

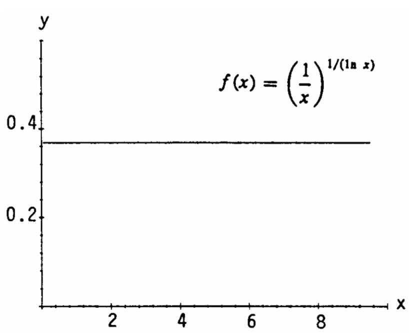


2. (a)

x	10	100	1000
$\left(\frac{1}{x}\right)^{1/(\ln x)}$	0.3679	0.3679	0.3679

Apparently, $\lim\limits_{x \to \infty} \left(\frac{1}{x}\right)^{1/(\ln x)} = 0.3679 = \frac{1}{e}$

(b)



3. $\lim\limits_{v \to c^-} L = \lim\limits_{v \to c^-} L_0 \sqrt{1 - \frac{v^2}{c^2}} = L_0 \sqrt{1 - \frac{\lim\limits_{v \to c^-} v^2}{c^2}} = L_0 \sqrt{1 - \frac{c^2}{c^2}} = 0$

The left-hand limit was needed because the function L is undefined if $v > c$ (the rocket cannot move faster than the speed of light).

4. (a) $\left|\frac{\sqrt{x}}{2} - 1\right| < 0.2 \Rightarrow -0.2 < \frac{\sqrt{x}}{2} - 1 < 0.2 \Rightarrow 0.8 < \frac{\sqrt{x}}{2} < 1.2 \Rightarrow 1.6 < \sqrt{x} < 2.4 \Rightarrow 2.56 < x < 5.76.$

(b) $\left|\frac{\sqrt{x}}{2} - 1\right| < 0.1 \Rightarrow -0.1 < \frac{\sqrt{x}}{2} - 1 < 0.1 \Rightarrow 0.9 < \frac{\sqrt{x}}{2} < 1.1 \Rightarrow 1.8 < \sqrt{x} < 2.2 \Rightarrow 3.24 < x < 4.84.$

5. $|10 + (t - 70) \times 10^{-4} - 10| < 0.0005 \Rightarrow |(t - 70) \times 10^{-4}| < 0.0005 \Rightarrow -0.0005 < (t - 70) \times 10^{-4} < 0.0005$
$\Rightarrow -5 < t - 70 < 5 \Rightarrow 65° < t < 75° \Rightarrow$ Within 5° F.

6. We want to know in what interval to hold values of h to make V satisfy the inequality
$|V - 1000| = |36\pi h - 1000| \le 10$. To find out, we solve the inequality:
$|36\pi h - 1000| \le 10 \Rightarrow -10 \le 36\pi h - 1000 \le 10 \Rightarrow 990 \le 36\pi h \le 1010 \Rightarrow \frac{990}{36\pi} \le h \le \frac{1010}{36\pi}$

$\Rightarrow 8.8 \le h \le 8.9$. where 8.8 was rounded up, to be safe, and 8.9 was rounded down, to be safe.
The interval in which we should hold h is about $8.9 - 8.8 = 0.1$ cm wide (1 mm). With stripes 1 mm wide, we can expect to measure a liter of water with an accuracy of 1%, which is more than enough accuracy for cooking.

7. Show $\lim_{x \to 1} f(x) = \lim_{x \to 1} (x^2 - 7) = -6 = f(1)$.
Step 1: $|(x^2 - 7) + 6| < \epsilon \Rightarrow -\epsilon < x^2 - 1 < \epsilon \Rightarrow 1 - \epsilon < x^2 < 1 + \epsilon \Rightarrow \sqrt{1-\epsilon} < x < \sqrt{1+\epsilon}$.
Step 2: $|x - 1| < \delta \Rightarrow -\delta < x - 1 < \delta \Rightarrow -\delta + 1 < x < \delta + 1$.
Then $-\delta + 1 = \sqrt{1-\epsilon}$ or $\delta + 1 = \sqrt{1+\epsilon}$. Choose $\delta = \min\left\{1 - \sqrt{1-\epsilon}, \sqrt{1+\epsilon} - 1\right\}$, then
$0 < |x - 1| < \delta \Rightarrow |(x^2 - 7) - 6| < \epsilon$ and $\lim_{x \to 1} f(x) = -6$. By the continuity test, f(x) is continuous at $x = 1$.

8. Show $\lim_{x \to \frac{1}{4}} g(x) = \lim_{x \to \frac{1}{4}} \frac{1}{2x} = 2 = g\left(\frac{1}{4}\right)$.
Step 1: $\left|\frac{1}{2x} - 2\right| < \epsilon \Rightarrow -\epsilon < \frac{1}{2x} - 2 < \epsilon \Rightarrow 2 - \epsilon < \frac{1}{2x} < 2 + \epsilon \Rightarrow \frac{1}{4-2\epsilon} > x > \frac{1}{4+2\epsilon}$.
Step 2: $\left|x - \frac{1}{4}\right| < \delta \Rightarrow -\delta < x - \frac{1}{4} < \delta \Rightarrow -\delta + \frac{1}{4} < x < \delta + \frac{1}{4}$.
Then $-\delta + \frac{1}{4} = \frac{1}{4+2\epsilon} \Rightarrow \delta = \frac{1}{4} - \frac{1}{4+2\epsilon} = \frac{\epsilon}{4(2+\epsilon)}$, or $\delta + \frac{1}{4} = \frac{1}{4-2\epsilon} \Rightarrow \delta = \frac{1}{4-2\epsilon} - \frac{1}{4} = \frac{\epsilon}{4(2-\epsilon)}$.
Choose $\delta = \frac{\epsilon}{4(2+\epsilon)}$, the smaller of the two values. Then $0 < \left|x - \frac{1}{4}\right| < \delta \Rightarrow \left|\frac{1}{2x} - 2\right| < \epsilon$ and $\lim_{x \to \frac{1}{4}} \frac{1}{2x} = 2$.
By the continuity test, g(x) is continuous at $x = \frac{1}{4}$.

9. Show $\lim_{x \to 2} h(x) = \lim_{x \to 2} \sqrt{2x - 3} = 1 = h(2)$.
Step 1: $\left|\sqrt{2x-3} - 1\right| < \epsilon \Rightarrow -\epsilon < \sqrt{2x-3} - 1 < \epsilon \Rightarrow 1 - \epsilon < \sqrt{2x-3} < 1 + \epsilon \Rightarrow \frac{(1-\epsilon)^2 + 3}{2} < x < \frac{(1+\epsilon)^2 + 3}{2}$.
Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta$ or $-\delta + 2 < x < \delta + 2$.
Then $-\delta + 2 = \frac{(1-\epsilon)^2 + 3}{2} \Rightarrow \delta = 2 - \frac{(1-\epsilon)^2 + 3}{2} = \frac{1 - (1-\epsilon)^2}{2} = \epsilon - \frac{\epsilon^2}{2}$, or $\delta + 2 = \frac{(1+\epsilon)^2 + 3}{2}$
$\Rightarrow \delta = \frac{(1+\epsilon)^2 + 3}{2} - 2 = \frac{(1+\epsilon)^2 - 1}{2} = \epsilon + \frac{\epsilon^2}{2}$. Choose $\delta = \epsilon - \frac{\epsilon^2}{2}$, the smaller of the two values. Then,
$0 < |x - 2| < \delta \Rightarrow \left|\sqrt{2x-3} - 1\right| < \epsilon$, so $\lim_{x \to 2} \sqrt{2x-3} = 1$. By the continuity test, h(x) is continuous at $x = 2$.

10. Show $\lim_{x \to 5} F(x) = \lim_{x \to 5} \sqrt{9 - x} = 2 = F(5)$.
Step 1: $\left|\sqrt{9-x} - 2\right| < \epsilon \Rightarrow -\epsilon < \sqrt{9-x} - 2 < \epsilon \Rightarrow 9 - (2-\epsilon)^2 > x > 9 - (2+\epsilon)^2$.
Step 2: $0 < |x - 5| < \delta \Rightarrow -\delta < x - 5 < \delta \Rightarrow -\delta + 5 < x < \delta + 5$.
Then $-\delta + 5 = 9 - (2+\epsilon)^2 \Rightarrow \delta = (2+\epsilon)^2 - 4 = \epsilon^2 + 2\epsilon$, or $\delta + 5 = 9 - (2-\epsilon)^2 \Rightarrow \delta = 4 - (2-\epsilon)^2 = \epsilon^2 - 2\epsilon$.
Choose $\delta = \epsilon^2 - 2\epsilon$, the smaller of the two values. Then, $0 < |x - 5| < \delta \Rightarrow \left|\sqrt{9-x} - 2\right| < \epsilon$, so
$\lim_{x \to 5} \sqrt{9-x} = 2$. By the continuity test, F(x) is continuous at $x = 5$.

11. Suppose L_1 and L_2 are two different limits. Without loss of generality assume $L_2 > L_1$. Let $\epsilon = \frac{1}{3}(L_2 - L_1)$.
Since $\lim_{x \to x_0} f(x) = L_1$ there is a $\delta_1 > 0$ such that $0 < |x - x_0| < \delta_1 \Rightarrow |f(x) - L_1| < \epsilon \Rightarrow -\epsilon < f(x) - L_1 < \epsilon$
$\Rightarrow -\frac{1}{3}(L_2 - L_1) + L_1 < f(x) < \frac{1}{3}(L_2 - L_1) + L_1 \Rightarrow 4L_1 - L_2 < 3f(x) < 2L_1 + L_2$. Likewise, $\lim_{x \to x_0} f(x) = L_2$
so there is a δ_2 such that $0 < |x - x_0| < \delta_2 \Rightarrow |f(x) - L_2| < \epsilon \Rightarrow -\epsilon < f(x) - L_2 < \epsilon$
$\Rightarrow -\frac{1}{3}(L_2 - L_1) + L_2 < f(x) < \frac{1}{3}(L_2 - L_1) + L_2 \Rightarrow 2L_2 + L_1 < 3f(x) < 4L_2 - L_1$
$\Rightarrow L_1 - 4L_2 < -3f(x) < -2L_2 - L_1$. If $\delta = \min\{\delta_1, \delta_2\}$ both inequalities must hold for $0 < |x - x_0| < \delta$:
$$\left.\begin{array}{r} 4L_1 - L_2 < \;\; 3f(x) < \;\; 2L_1 + L_2 \\ L_1 - 4L_2 < -3f(x) < -2L_2 - L_1 \end{array}\right\} \Rightarrow 5(L_1 - L_2) < 0 < L_1 - L_2.$$
That is, $L_1 - L_2 < 0$ <u>and</u> $L_1 - L_2 > 0$, a contradiction.

12. Suppose $\lim_{x\to c} f(x) = L$. If $k = 0$, then $\lim_{x\to c} kf(x) = \lim_{x\to c} 0 = 0 = 0 \cdot \lim_{x\to c} f(x)$ and we are done.
If $k \neq 0$, then given any $\epsilon > 0$, there is a $\delta > 0$ so that $0 < |x - c| < \delta \Rightarrow |f(x) - L| < \frac{\epsilon}{|k|} \Rightarrow |k||f(x) - L| < \epsilon$
$\Rightarrow |k(f(x) - L)| < \epsilon \Rightarrow |(kf(x)) - (kL)| < \epsilon$. Thus, $\lim_{x\to c} kf(x) = kL = k\left(\lim_{x\to c} f(x)\right)$.

13. (a) Since $x \to 0^+$, $0 < x^3 < x < 1 \Rightarrow (x^3 - x) \to 0^- \Rightarrow \lim_{x\to 0^+} f(x^3 - x) = \lim_{y\to 0^-} f(y) = B$ where $y = x^3 - x$.
(b) Since $x \to 0^-$, $-1 < x < x^3 < 0 \Rightarrow (x^3 - x) \to 0^+ \Rightarrow \lim_{x\to 0^-} f(x^3 - x) = \lim_{y\to 0^+} f(y) = A$ where $y = x^3 - x$.
(c) Since $x \to 0^+$, $0 < x^4 < x^2 < 1 \Rightarrow (x^2 - x^4) \to 0^+ \Rightarrow \lim_{x\to 0^+} f(x^2 - x^4) = \lim_{y\to 0^+} f(y) = A$ where $y = x^2 - x^4$.
(d) Since $x \to 0^-$, $-1 < x < 0 \Rightarrow 0 < x^4 < x^2 < 1 \Rightarrow (x^2 - x^4) \to 0^+ \Rightarrow \lim_{x\to 0^+} f(x^2 - x^4) = A$ as in part (c).

14. (a) True, because if $\lim_{x\to a} (f(x) + g(x))$ exists then $\lim_{x\to a} (f(x) + g(x)) - \lim_{x\to a} f(x) = \lim_{x\to a} [(f(x) + g(x)) - f(x)]$
$= \lim_{x\to a} g(x)$ exists, contrary to assumption.
(b) False; for example take $f(x) = \frac{1}{x}$ and $g(x) = -\frac{1}{x}$. Then neither $\lim_{x\to 0} f(x)$ nor $\lim_{x\to 0} g(x)$ exists, but
$\lim_{x\to 0} (f(x) + g(x)) = \lim_{x\to 0} \left(\frac{1}{x} - \frac{1}{x}\right) = \lim_{x\to 0} 0 = 0$ exists.
(c) True, because $g(x) = |x|$ is continuous $\Rightarrow g(f(x)) = |f(x)|$ is continuous (it is the composite of continuous functions).
(d) False; for example let $f(x) = \begin{cases} -1, & x \leq 0 \\ 1, & x > 0 \end{cases} \Rightarrow f(x)$ is discontinuous at $x = 0$. However $|f(x)| = 1$ is continuous at $x = 0$.

15. Show $\lim_{x\to -1} f(x) = \lim_{x\to -1} \frac{x^2-1}{x+1} = \lim_{x\to -1} \frac{(x+1)(x-1)}{(x+1)} = -2$, $x \neq -1$.
Define the continuous extension of $f(x)$ as $F(x) = \begin{cases} \frac{x^2-1}{x+1}, & x \neq -1 \\ -2, & x = -1 \end{cases}$. We now prove the limit of $f(x)$ as $x \to -1$ exists and has the correct value.
Step 1: $\left|\frac{x^2-1}{x+1} - (-2)\right| < \epsilon \Rightarrow -\epsilon < \frac{(x+1)(x-1)}{(x+1)} + 2 < \epsilon \Rightarrow -\epsilon < (x-1) + 2 < \epsilon, x \neq -1 \Rightarrow -\epsilon - 1 < x < \epsilon - 1$.
Step 2: $|x - (-1)| < \delta \Rightarrow -\delta < x + 1 < \delta \Rightarrow -\delta - 1 < x < \delta - 1$.
Then $-\delta - 1 = -\epsilon - 1 \Rightarrow \delta = \epsilon$, or $\delta - 1 = \epsilon - 1 \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$. Then $0 < |x - (-1)| < \delta$
$\Rightarrow \left|\frac{x^2-1}{x+1} - (-2)\right| < \epsilon \Rightarrow \lim_{x\to -1} F(x) = -2$. Since the conditions of the continuity test are met by $F(x)$, then $f(x)$ has a continuous extension to $F(x)$ at $x = -1$.

16. Show $\lim_{x\to 3} g(x) = \lim_{x\to 3} \frac{x^2-2x-3}{2x-6} = \lim_{x\to 3} \frac{(x-3)(x+1)}{2(x-3)} = 2$, $x \neq 3$.
Define the continuous extension of $g(x)$ as $G(x) = \begin{cases} \frac{x^2-2x-3}{2x-6}, & x \neq 3 \\ 2, & x = 3 \end{cases}$. We now prove the limit of $g(x)$ as $x \to 3$ exists and has the correct value.
Step 1: $\left|\frac{x^2-2x-3}{2x-6} - 2\right| < \epsilon \Rightarrow -\epsilon < \frac{(x-3)(x+1)}{2(x-3)} - 2 < \epsilon \Rightarrow -\epsilon < \frac{x+1}{2} - 2 < \epsilon, x \neq 3 \Rightarrow 3 - 2\epsilon < x < 3 + 2\epsilon$.
Step 2: $|x - 3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow 3 - \delta < x < \delta + 3$.
Then, $3 - \delta = 3 - 2\epsilon \Rightarrow \delta = 2\epsilon$, or $\delta + 3 = 3 + 2\epsilon \Rightarrow \delta = 2\epsilon$. Choose $\delta = 2\epsilon$. Then $0 < |x - 3| < \delta$
$\Rightarrow \left|\frac{x^2-2x-3}{2x-6} - 2\right| < \epsilon \Rightarrow \lim_{x\to 3} \frac{(x-3)(x+1)}{2(x-3)} = 2$. Since the conditions of the continuity test hold for $G(x)$, $g(x)$ can be continuously extended to $G(x)$ at $x = 3$.

17. (a) Let $\epsilon > 0$ be given. If x is rational, then $f(x) = x \Rightarrow |f(x) - 0| = |x - 0| < \epsilon \Leftrightarrow |x - 0| < \epsilon$; i.e., choose $\delta = \epsilon$. Then $|x - 0| < \delta \Rightarrow |f(x) - 0| < \epsilon$ for x rational. If x is irrational, then $f(x) = 0 \Rightarrow |f(x) - 0| < \epsilon \Leftrightarrow 0 < \epsilon$ which is true no matter how close irrational x is to 0, so again we can choose $\delta = \epsilon$. In either case, given $\epsilon > 0$ there is a $\delta = \epsilon > 0$ such that $0 < |x - 0| < \delta \Rightarrow |f(x) - 0| < \epsilon$. Therefore, f is continuous at $x = 0$.

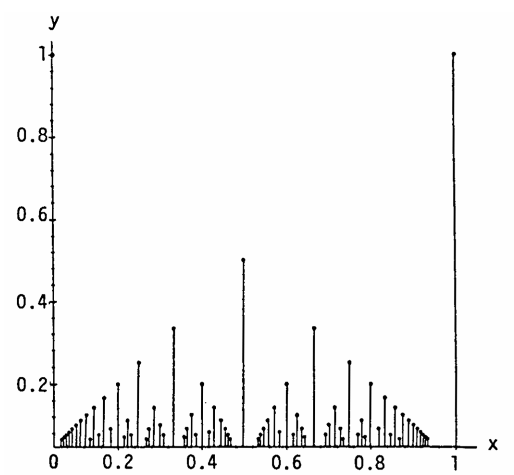
(b) Choose $x = c > 0$. Then within any interval $(c - \delta, c + \delta)$ there are both rational and irrational numbers. If c is rational, pick $\epsilon = \frac{c}{2}$. No matter how small we choose $\delta > 0$ there is an irrational number x in $(c - \delta, c + \delta) \Rightarrow |f(x) - f(c)| = |0 - c| = c > \frac{c}{2} = \epsilon$. That is, f is not continuous at any rational $c > 0$. On the other hand, suppose c is irrational $\Rightarrow f(c) = 0$. Again pick $\epsilon = \frac{c}{2}$. No matter how small we choose $\delta > 0$ there is a rational number x in $(c - \delta, c + \delta)$ with $|x - c| < \frac{c}{2} = \epsilon \Leftrightarrow \frac{c}{2} < x < \frac{3c}{2}$. Then $|f(x) - f(c)| = |x - 0| = |x| > \frac{c}{2} = \epsilon \Rightarrow$ f is not continuous at any irrational $c > 0$.

If $x = c < 0$, repeat the argument picking $\epsilon = \frac{|c|}{2} = \frac{-c}{2}$. Therefore f fails to be continuous at any nonzero value $x = c$.

18. (a) Let $c = \frac{m}{n}$ be a rational number in $[0, 1]$ reduced to lowest terms $\Rightarrow f(c) = \frac{1}{n}$. Pick $\epsilon = \frac{1}{2n}$. No matter how small $\delta > 0$ is taken, there is an irrational number x in the interval $(c - \delta, c + \delta) \Rightarrow |f(x) - f(c)| = \left|0 - \frac{1}{n}\right| = \frac{1}{n} > \frac{1}{2n} = \epsilon$. Therefore f is discontinuous at $x = c$, a rational number.

(b) Now suppose c is an irrational number $\Rightarrow f(c) = 0$. Let $\epsilon > 0$ be given. Notice that $\frac{1}{2}$ is the only rational number reduced to lowest terms with denominator 2 and belonging to $[0, 1]$; $\frac{1}{3}$ and $\frac{2}{3}$ the only rationals with denominator 3 belonging to $[0, 1]$; $\frac{1}{4}$ and $\frac{3}{4}$ with denominator 4 in $[0, 1]$; $\frac{1}{5}, \frac{2}{5}, \frac{3}{5}$ and $\frac{4}{5}$ with denominator 5 in $[0, 1]$; etc. In general, choose N so that $\frac{1}{N} < \epsilon \Rightarrow$ there exist only finitely many rationals in $[0, 1]$ having denominator $\le N$, say $r_1, r_2, \ldots, r_p$. Let $\delta = \min\{|c - r_i| : i = 1, \ldots, p\}$. Then the interval $(c - \delta, c + \delta)$ contains no rational numbers with denominator $\le N$. Thus, $0 < |x - c| < \delta \Rightarrow |f(x) - f(c)| = |f(x) - 0| = |f(x)| \le \frac{1}{N} < \epsilon \Rightarrow$ f is continuous at $x = c$ irrational.

(c) The graph looks like the markings on a typical ruler when the points $(x, f(x))$ on the graph of $f(x)$ are connected to the x-axis with vertical lines.



$$f(x) = \begin{cases} 1/n & \text{if } x = m/n \text{ is a rational number in lowest terms} \\ 0 & \text{if } x \text{ is irrational} \end{cases}$$

19. Yes. Let R be the radius of the equator (earth) and suppose at a fixed instant of time we label noon as the zero point, 0, on the equator $\Rightarrow 0 + \pi R$ represents the midnight point (at the same exact time). Suppose x_1 is a point on the equator “just after" noon $\Rightarrow x_1 + \pi R$ is simultaneously “just after" midnight. It seems reasonable that the temperature T at a point just after noon is hotter than it would be at the diametrically opposite point just after midnight: That is, $T(x_1) - T(x_1 + \pi R) > 0$. At exactly the same moment in time pick x_2 to be a point just before midnight $\Rightarrow x_2 + \pi R$ is just before noon. Then $T(x_2) - T(x_2 + \pi R) < 0$.

Assuming the temperature function T is continuous along the equator (which is reasonable), the Intermediate Value Theorem says there is a point c between 0 (noon) and πR (simultaneously midnight) such that $T(c) - T(c + \pi R) = 0$; i.e., there is always a pair of antipodal points on the earth's equator where the temperatures are the same.

20. $\lim\limits_{x \to c} f(x)g(x) = \lim\limits_{x \to c} \frac{1}{4}\left[(f(x)+g(x))^2 - (f(x)-g(x))^2\right] = \frac{1}{4}\left[\left(\lim\limits_{x \to c}(f(x)+g(x))\right)^2 - \left(\lim\limits_{x \to c}(f(x)-g(x))\right)^2\right]$
$= \frac{1}{4}\left(3^2 - (-1)^2\right) = 2.$

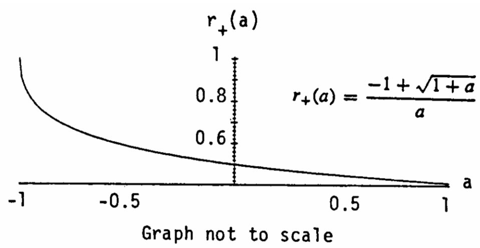
21. (a) At $x = 0$: $\lim\limits_{a \to 0} r_+(a) = \lim\limits_{a \to 0} \frac{-1+\sqrt{1+a}}{a} = \lim\limits_{a \to 0} \left(\frac{-1+\sqrt{1+a}}{a}\right)\left(\frac{-1-\sqrt{1+a}}{-1-\sqrt{1+a}}\right)$
$= \lim\limits_{a \to 0} \frac{1-(1+a)}{a\left(-1-\sqrt{1+a}\right)} = \frac{-1}{-1-\sqrt{1+0}} = \frac{1}{2}$

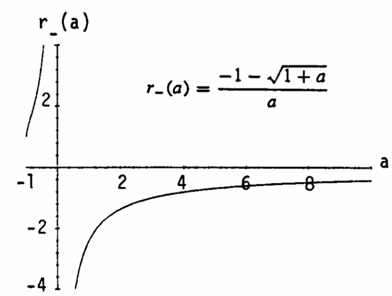
At $x = -1$: $\lim\limits_{a \to -1^+} r_+(a) = \lim\limits_{a \to -1^+} \frac{1-(1+a)}{a\left(-1-\sqrt{1+a}\right)} = \lim\limits_{a \to -1} \frac{-a}{a\left(-1-\sqrt{1+a}\right)} = \frac{-1}{-1-\sqrt{0}} = 1$

(b) At $x = 0$: $\lim\limits_{a \to 0^-} r_-(a) = \lim\limits_{a \to 0^-} \frac{-1-\sqrt{1+a}}{a} = \lim\limits_{a \to 0^-} \left(\frac{-1-\sqrt{1+a}}{a}\right)\left(\frac{-1+\sqrt{1+a}}{-1+\sqrt{1+a}}\right)$
$= \lim\limits_{a \to 0^-} \frac{1-(1+a)}{a\left(-1+\sqrt{1+a}\right)} = \lim\limits_{a \to 0^-} \frac{-a}{a\left(-1+\sqrt{1+a}\right)} = \lim\limits_{a \to 0^-} \frac{-1}{-1+\sqrt{1+a}} = \infty$ (because the denominator is always negative); $\lim\limits_{a \to 0^+} r_-(a) = \lim\limits_{a \to 0^+} \frac{-1}{-1+\sqrt{1+a}} = -\infty$ (because the denominator is always positive). Therefore, $\lim\limits_{a \to 0} r_-(a)$ does not exist.

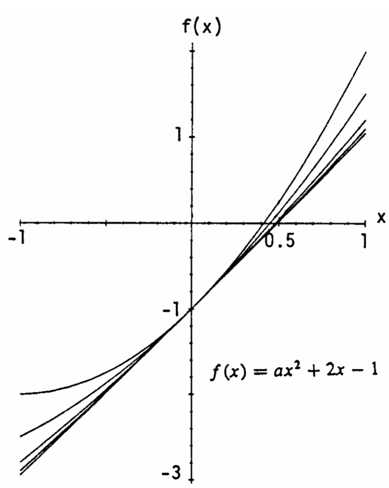
At $x = -1$: $\lim\limits_{a \to -1^+} r_-(a) = \lim\limits_{a \to -1^+} \frac{-1-\sqrt{1+a}}{a} = \lim\limits_{a \to -1^+} \frac{-1}{-1+\sqrt{1+a}} = 1$

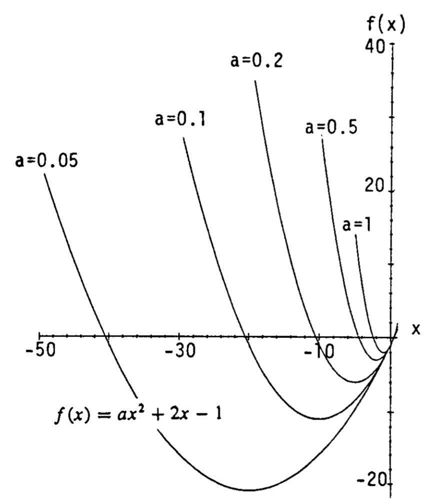
(c)





(d)





22. $f(x) = x + 2\cos x \Rightarrow f(0) = 0 + 2\cos 0 = 2 > 0$ and $f(-\pi) = -\pi + 2\cos(-\pi) = -\pi - 2 < 0$. Since f(x) is continuous on $[-\pi, 0]$, by the Intermediate Value Theorem, f(x) must take on every value between $[-\pi - 2, 2]$. Thus there is some number c in $[-\pi, 0]$ such that $f(c) = 0$; i.e., c is a solution to $x + 2\cos x = 0$.

23. (a) The function f is bounded on D if $f(x) \ge M$ and $f(x) \le N$ for all x in D. This means $M \le f(x) \le N$ for all x in D. Choose B to be $\max\{|M|, |N|\}$. Then $|f(x)| \le B$. On the other hand, if $|f(x)| \le B$, then $-B \le f(x) \le B \Rightarrow f(x) \ge -B$ and $f(x) \le B \Rightarrow$ f(x) is bounded on D with $N = B$ an upper bound and $M = -B$ a lower bound.

(b) Assume $f(x) \le N$ for all x and that $L > N$. Let $\epsilon = \frac{L-N}{2}$. Since $\lim\limits_{x \to x_0} f(x) = L$ there is a $\delta > 0$ such that $0 < |x - x_0| < \delta \Rightarrow |f(x) - L| < \epsilon \Leftrightarrow L - \epsilon < f(x) < L + \epsilon \Leftrightarrow L - \frac{L-N}{2} < f(x) < L + \frac{L-N}{2}$ $\Leftrightarrow \frac{L+N}{2} < f(x) < \frac{3L-N}{2}$. But $L > N \Rightarrow \frac{L+N}{2} > N \Rightarrow N < f(x)$ contrary to the boundedness assumption $f(x) \le N$. This contradiction proves $L \le N$.

(c) Assume $M \le f(x)$ for all x and that $L < M$. Let $\epsilon = \frac{M-L}{2}$. As in part (b), $0 < |x - x_0| < \delta$ $\Rightarrow L - \frac{M-L}{2} < f(x) < L + \frac{M-L}{2} \Leftrightarrow \frac{3L-M}{2} < f(x) < \frac{M+L}{2} < M$, a contradiction.

24. (a) If $a \ge b$, then $a - b \ge 0 \Rightarrow |a - b| = a - b \Rightarrow \max\{a, b\} = \frac{a+b}{2} + \frac{|a-b|}{2} = \frac{a+b}{2} + \frac{a-b}{2} = \frac{2a}{2} = a$.
If $a \le b$, then $a - b \le 0 \Rightarrow |a - b| = -(a - b) = b - a \Rightarrow \max\{a, b\} = \frac{a+b}{2} + \frac{|a-b|}{2} = \frac{a+b}{2} + \frac{b-a}{2}$ $= \frac{2b}{2} = b$.

(b) Let $\min\{a, b\} = \frac{a+b}{2} - \frac{|a-b|}{2}$.

25. $$\lim_{x \to 0} \frac{\sin(1-\cos x)}{x} = \lim_{x \to 0} \frac{\sin(1-\cos x)}{1-\cos x} \cdot \frac{1-\cos x}{x} \cdot \frac{1+\cos x}{1+\cos x} = \lim_{x \to 0} \frac{\sin(1-\cos x)}{1-\cos x} \cdot \lim_{x \to 0} \frac{1-\cos^2 x}{x(1+\cos x)} = 1 \cdot \lim_{x \to 0} \frac{\sin^2 x}{x(1+\cos x)}$$
$$= \lim_{x \to 0} \frac{\sin x}{x} \cdot \frac{\sin x}{1+\cos x} = 1 \cdot \left(\frac{0}{2}\right) = 0.$$

26. $$\lim_{x \to 0^+} \frac{\sin x}{\sin \sqrt{x}} = \lim_{x \to 0^+} \frac{\sin x}{x} \cdot \frac{\sqrt{x}}{\sin \sqrt{x}} \cdot \frac{x}{\sqrt{x}} = 1 \cdot \lim_{x \to 0^+} \frac{1}{\left(\frac{\sin \sqrt{x}}{\sqrt{x}}\right)} \cdot \lim_{x \to 0^+} \sqrt{x} = 1 \cdot 0 \cdot 0 = 0.$$

27. $$\lim_{x \to 0} \frac{\sin(\sin x)}{x} = \lim_{x \to 0} \frac{\sin(\sin x)}{\sin x} \cdot \frac{\sin x}{x} = \lim_{x \to 0} \frac{\sin(\sin x)}{\sin x} \cdot \lim_{x \to 0} \frac{\sin x}{x} = 1 \cdot 1 = 1.$$

28. $$\lim_{x \to 0} \frac{\sin(x^2+x)}{x} = \lim_{x \to 0} \frac{\sin(x^2+x)}{x^2+x} \cdot (x+1) = \lim_{x \to 0} \frac{\sin(x^2+x)}{x^2+x} \cdot \lim_{x \to 0} (x+1) = 1 \cdot 1 = 1$$

29. $$\lim_{x \to 2} \frac{\sin(x^2-4)}{x-2} = \lim_{x \to 2} \frac{\sin(x^2-4)}{x^2-4} \cdot (x+2) = \lim_{x \to 2} \frac{\sin(x^2-4)}{x^2-4} \cdot \lim_{x \to 2} (x+2) = 1 \cdot 4 = 4$$

30. $$\lim_{x \to 9} \frac{\sin(\sqrt{x}-3)}{x-9} = \lim_{x \to 9} \frac{\sin(\sqrt{x}-3)}{\sqrt{x}-3} \cdot \frac{1}{\sqrt{x}+3} = \lim_{x \to 9} \frac{\sin(\sqrt{x}-3)}{\sqrt{x}-3} \cdot \lim_{x \to 9} \frac{1}{\sqrt{x}+3} = 1 \cdot \frac{1}{6} = \frac{1}{6}$$

31. Since the highest power of x in the numerator is 1 more than the highest power of x in the denominator, there is an oblique asymptote. $y = \frac{2x^{3/2} + 2x - 3}{\sqrt{x}+1} = 2x - \frac{3}{\sqrt{x}+1}$, thus the oblique asymptote is $y = 2x$.

32. As $x \to \pm\infty$, $\frac{1}{x} \to 0 \Rightarrow \sin\left(\frac{1}{x}\right) \to 0 \Rightarrow 1 + \sin\left(\frac{1}{x}\right) \to 1$, thus as $x \to \pm\infty$, $y = x + x\sin\left(\frac{1}{x}\right) = x\left(1 + \sin\left(\frac{1}{x}\right)\right) \to x$; thus the oblique asymptote is $y = x$.

33. As $x \to \pm\infty$, $x^2 + 1 \to x^2 \Rightarrow \sqrt{x^2+1} \to \sqrt{x^2}$; as $x \to -\infty$, $\sqrt{x^2} = -x$, and as $x \to +\infty$, $\sqrt{x^2} = x$; thus the oblique asymptotes are $y = x$ and $y = -x$.

34. As $x \to \pm\infty$, $x + 2 \to x \Rightarrow \sqrt{x^2 + 2x} = \sqrt{x(x+2)} \to \sqrt{x^2}$; as $x \to -\infty$, $\sqrt{x^2} = -x$, and as $x \to +\infty$, $\sqrt{x^2} = x$; asymptotes are $y = x$ and $y = -x$.
