# TEST BANK

#### True / False

- 1. A relational database handles entities, attributes, and relationships by storing each entity in its own table.
  - a. True
  - b. False

ANSWER: True POINTS: 1
REFERENCES: 31

- 2. The attributes of an entity become the fields or columns in a table.
  - a. True
  - b. False

ANSWER: True POINTS: 1
REFERENCES: 31

- 3. Each column in a table should have a unique name, and entries in each column should all "match" this column name.
  - a. True
  - b. False

ANSWER: True POINTS: 1
REFERENCES: 31

- 4. In a relation, the order of the columns is important.
  - a. True
  - b. False

ANSWER: False POINTS: 1
REFERENCES: 31

- 5. In a relation, the order of rows is important.
  - a. True
  - b. False

ANSWER: False POINTS: 1
REFERENCES: 31

- 6. A relational database is a collection of relations.
  - a. True
  - b. False

ANSWER: True POINTS: 1
REFERENCES: 31

- 7. An unnormalized relation is a table that has more than one row.
  - a. True

b. False ANSWER: False **POINTS:** 1 REFERENCES: 31 8. A column whose value uniquely identifies a given row in the table is the secondary key. a. True b. False ANSWER: False POINTS: REFERENCES: 32 9. A query is a question represented in a way that the DBMS can recognize and process. a. True b. False ANSWER: True POINTS: 1 REFERENCES: 32 10. QBE is a visual approach to writing queries. a. True b. False ANSWER: True POINTS: 1 REFERENCES: 32 11. Access automatically adds double quotation marks around values in the design grid that are formatted as Short Text fields when you run the query or move the insertion point to another cell in the design grid. a. True b. False ANSWER: True **POINTS:** REFERENCES: 37 12. The comparison operators are +, \*, %, and /. a. True b. False ANSWER: False **POINTS:** 1 REFERENCES: 37 13. The comparison operators are also known as relational operators. a. True

True

b. False

ANSWER:

POINTS:	1
REFERENCES:	37
	criterion, the overall criterion is true if either of the individual criteria is true.
a. True	
b. False	
ANSWER:	False
POINTS:	1
REFERENCES:	31
15. The concept	of grouping means that statistics will be calculated for individual records.
a. True	
b. False	
ANSWER:	False
POINTS:	1
REFERENCES:	44
Multiple Choice	e
16. A relation is	a(n)
a. attribute	
b. column	
c. field	
d. table	
ANSWER:	d
POINTS:	1
REFERENCES:	31
17 Daged on the	etatement below, which of the fellowing is the mimory leave
	statement below, which of the following is the primary key?  LastName, FirstName, Street, City, State, PostalCode Commission, Rate)
a. RepNum	Lastitume, 1 tristitume, Street, City, State, 1 ostateode Commission, Tate)
b. LastName	e
c. FirstNam	
d. State	
ANSWER:	a
POINTS:	1
REFERENCES:	
18. When duplic	ate column names exist in a database and you need to indicate the column to which you are referring,
a. do not use	e these two tables together
b. do not us	e the column names in the same statement
c. write both	n the table name and the column name, separated by a period
	table name only
ANSWER:	c

# Chapter 2: The Relational Model 1: Introduction, QBE, and Relational Algebra **POINTS:** 1 REFERENCES: 32 19. Rows are also called \_\_\_\_\_. a. fields b. columns c. tuples d. attributes ANSWER: **POINTS:** REFERENCES: 32 20. The \_\_\_\_ key of a table is the column or collection of columns that uniquely identifies a given row in that table. a. primary b. secondary c. foreign d. minor ANSWER: **POINTS:** 1 REFERENCES: 32 21. The compound criteria (conditions) are created by using \_\_\_\_. a. AND, OR b. AND, NOR c. OR, NOT d. NOT, ONLY ANSWER: **POINTS:** 1 REFERENCES: 37 22. Count, Sum, Avg, Max, and Min are a few of the built-in statistics or \_\_\_\_ functions that can be used in a query. a. accumulated b. allowed c. primary d. aggregate ANSWER: d **POINTS:** 1 REFERENCES: 42 23. If you are sorting records by more than one field, the more important field is called the \_\_\_\_\_. a. primary sort key

b. secondary sort keyc. maximum sort keyd. minor sort key

ANSWER:

POINTS:	1

Essay	
46. Provide a de	finition for the term relation.
ANSWER:	A relation is a two-dimensional table in which:
	1. The entries in the table are single-valued; that is, each location in the table contains a single
	entry.
	2. Each column has a distinct name
	3. All values in a column are values of the same attributes
	4. The order of columns is immaterial
	5. Each row is distinct

6. The order of rows is immaterial

**POINTS:** 1 REFERENCES: 31

47. What is the difference between an AND criterion and an OR criterion? How is each criterion created in OBE?

ANSWER:

In an AND criterion, both criteria must be true for the compound criterion to be true. In an OR criterion, the overall criterion is true if either of the individual criteria is true. In QBE, to create an AND criterion, place the criteria for multiple fields on the same Criteria row in the design grid; to create an OR criterion, place the criteria for multiple fields on different Criteria rows in

the design grid.

**POINTS:** REFERENCES: 37

48. List at least six of the aggregate functions available in Access. Explain how to use any of these functions in a query.

ANSWER:

All products that support QBE, including Access, support the following built-in functions (called aggregate functions in Access): Count, Sum, Avg (average), Max (largest value), Min (smallest value), StDev (standard deviation), Var (variance), First, and Last. To use any of these functions in a query, you include them in the Total row for the desired column in the design grid. By default, the Total row does not appear automatically in the design grid. To include it, you must click the Totals button in the Show/Hide group on the Ouery Tools Design tab.

**POINTS:** REFERENCES: 42

49. Discuss the difference between the major sort key and the minor sort key.

ANSWER:

To list the records in query results in a particular way, you need to **sort** the records. The field on which records are sorted is called the **sort key**; you can sort records using more than one field when necessary. When you are sorting records by more than one field (such as sorting by rep number and then by customer name), the first sort field (RepNum) is called the major sort key (also called the primary sort key) and the second sort field (CustomerName) is called the minor sort key (also called the secondary sort key).

**POINTS:** REFERENCES: 45

50. Explain what relational algebra is and how it is used.

ANSWER:

Relational algebra is a theoretical way of manipulating a relational database. Relational algebra includes operations that act on existing tables to produce new tables, similar to the way the operations of addition and subtraction act on numbers to produce new numbers in the mathematical algebra with which you are familiar. Retrieving data from a relational database through the use of relational algebra involves issuing relational algebra commands to operate on existing tables to form a new table containing the desired information. Sometimes you might need to execute a series of commands to obtain the desired result.
