ANS:

Retailers usually divide goals and objectives into two dimensions: (1) market performance, which compares a firm's actions to its competitor's; and (2) financial performance, which analyzes the firm's ability to provide a profit level adequate to continue in business. In addition to the market performance and financial performance objectives, some retailers may also establish (3) societal objectives, which are phrased in terms of helping society fulfill some of its needs; and (4) personal objectives, which relate to helping people employed in retailing to fulfill some of their needs.

Market Performance Objectives: Market performance objectives establish the amount of dominance the retailer seeks in the marketplace. The most popular measures of market performance are sales volume and market share. Profitability is clearly and positively related to market share. Market performance objectives are pursued because they are a key profit path.

Financial Objectives: Retailers can establish many financial objectives, but they can all be fit into categories of profitability and productivity.

- Profitability Objectives: Profit-based objectives deal directly with the monetary return a retailer desires from its business. The most common way to define profit is the aggregate total of net profit after taxes. Another retail method of expressing profit is as a percentage of net sales. However, most retail owners feel the best way to define profit is in terms of return on investment (ROI). The strategic profit model (SPM) is a tool used to assess a firm's profitability. It contains five elements that include net profit margin, asset turnover, return on assets (ROA), financial leverage, and return on net worth (RONW). Another measure of profitability is the gross margin percentage, which is gross margin divided by net sales.
- Productivity Objectives: Productivity objectives state how much output the retailer desires for each unit of resource input. The major resources at the retailer's disposal are space, labor, and merchandise. Productivity objectives are vehicles by which a retailer can program its business for high-profit results. In short, productivity is a key determinant of profit in retailing.

Societal Objectives: Societal objectives highlight the retailer's concern with broader issues in society. The five most frequently cited societal objectives are employment objectives, payment of taxes, consumer choice, equity, and being a benefactor.

Personal Objectives: Personal objectives can relate to the personal goals of any of the employees, managers, or owners of the retail establishment. Generally, retailers tend to pursue three types of personal objectives: self-gratification, status and respect, and power and authority.

The retailer has to consider his/her objective(s) while deciding upon the retail strategy involving the retail mix, promotion, location, and so on.

PTS: 1 REF: p. 44-51 OBJ: LO 2-1

2. Explain the strategic profit model (SPM). How would a retailer use the SPM to assess its performance relative to the competition?

ANS:

The most frequently encountered profit objectives for a retailer are shown in the strategic profit model (SPM), a tool used to assess a firm's profitability. The five elements of the SPM elements include net profit margin, asset turnover, return on assets, financial leverage, and return on net worth.

- Net profit margin is the ratio of net profit (after taxes) to net sales. It shows how much profit a retailer makes on each dollar of sales after all expenses and taxes have been met.
- Asset turnover is computed by taking the retailer's annual net sales and dividing by total assets. This ratio shows how productively the firm's assets are being used.
- Return on assets (ROA), which is annual net profit divided by total assets, depicts the net profit return the retailer achieved on all assets invested regardless of whether the assets were financed by creditors or by the firm's owners. ROA is the result of multiplying the net profit margin by asset turnover.
- Financial leverage is total assets divided by net worth or owners' equity. This ratio shows the extent to which a retailer is using debt in its total capital structure.

• Return on net worth (RONW) is net profit divided by net worth or owner's equity. Return on net worth is usually used to measure owner's performance. The ROA multiplied by financial leverage yields RONW.

Retailers could use the information from any of the five SPM elements to compare their performance relative to the competition.

3. Discuss the components of SWOT analysis used by a retailer.

ANS:

A retailer who wants to develop a strategy to differentiate itself starts with an analysis of the retailer's strengths and weaknesses as well as the threats and opportunities that exist in the environment. This process, which is referred to as SWOT analysis (SWOT for strengths, weaknesses, opportunities, and threats), involves asking the following questions.

Strengths:

- What major competitive advantage(s) do we have?
- What are we good at?
- What do customers perceive as our strong points?

Weaknesses:

- What major competitive advantage(s) do competitors have over us? What are competitors better at than we are?
- What are our major internal weaknesses?

Opportunities:

- What favorable environmental trends may benefit our firm?
- What is the competition doing in our market?
- What areas of business that are closely related to ours are undeveloped?

Threats:

- What unfortunate environmental trends may hurt our future performance?
- What technology is on the horizon that may soon have an impact on our firm?

4. Explain why strategic planning is a necessary prerequisite for operations management.

ANS:

Strategic planning involves adapting the resources of the firm to the opportunities and threats of an ever-changing retail environment. Since operations management is concerned with maximizing the efficiency of the retailer's use of resources and with how the retailer converts these resources into sales and profits, all of these activities require day-to-day attention. The retail strategic planning and operations management model shows that operations management involves managing the buying and handling of merchandise, pricing, advertising and promotion, customer services and selling, and facilities. The cumulative effect of well-designed and executed strategic and operations plans will be the achievement of high profit. Mistakes in either of these two areas will severely hamper the retailer's performance and prevent it from being among the leaders in its industry.

5. Success in retailing is a function of strategic planning and operations management. Please explain the retail strategic planning and operations management model and the ways a retailer can employ this model in a globally competitive environment.

ANS:

Exhibit 2.6 provides the strategic planning and operations management model. Strategic planning involves adapting the resources of the firm to the opportunities and threats of an ever-changing retail environment. Considering the strategic plan, it involves the development of a mission statement for the firm, definition of specific goals and objectives for the firm, SWOT analysis, and development of basic strategies that will enable the firm to reach its objectives and fulfill its mission. It profiles the major environmental forces that should be assessed. Briefly, these are consumer behavior, competitor behavior, supply chain behavior, the socioeconomic environment, the technological environment, and the legal and ethical environment. Operations management is concerned with maximizing the efficiency of the retailer's use of resources and with how the retailer converts these resources into sales and profits. Regardless, when a retailer is able to do a good job at operations management, then the retailer is said to be operations effective. The need to strive for a high profit is tied to the extremely competitive nature of retailing. While concerning a globally competitive environment, consumer behavior, competitor behavior, supply chain behavior, the socioeconomic environment, the technological environment, and the legal and ethical environment should be taken into consideration.

6. What are the major environmental forces that should be constantly assessed by retailers?

ANS:

The major environmental forces that should be constantly assessed by retailers are:

- Consumer behavior: The retailer will need to understand the determinants of shopping behavior so that it can identify likely changes in that behavior and develop appropriate strategies.
- Competitor behavior: Retailers must develop a competitive strategy that is not easily imitated, which happens all too often with price cuts.
- Supply chain behavior: The behavior of members of the retailer's supply chain can have a significant impact on the retailer's future.
- Socioeconomic environment: The retailer must understand how economic and demographic trends will influence revenues and costs in the future and adapt its strategy according to these changes.
- Technological environment: The technical frontiers of the retail system encompass new and better ways of performing standard retail functions. The retailer must always be aware of opportunities for lowering operating costs.
- Legal and ethical environment: The retailer should be familiar with local, state, and federal regulations of the retail system. It must also understand evolving legal patterns in order to be able to design future retail strategies that are legally defensible. At the same time, the retailer must operate at the highest level of ethical behavior.
